Typical Applications

The Perfect Humidity™ with Hot Gas Reheat system provides a greater degree of operational flexibility and enhances humidity control for consistently maintaining year round indoor comfort temperature and humidity levels with a packaged rooftop unit. Benefits include:

Health Clubs — Shower areas and human perspiration can cause uncomfortable and higher humidity space conditions. In addition to human discomfort, these conditions can propagate the growth of mold and mildew.

Schools — Due to variable student occupancy with constant changes in ventilation air change requirements in each classroom, the proportion of latent load may be high and humidity may rise. High humidity levels can damage computer equipment or building structural materials. In addition, students entering and leaving classrooms may result in a variation in latent load for each room, which requires maximum part load dehumidification control.

Convenience Stores and Supermarkets — High humidity levels can cause inefficient operation of freezer and refrigeration systems. Over cooling can cause significant discomfort for customers.

Restaurants — The high degree of variable occupancy, along with kitchen areas of restaurants that have many humidity producing activities, such as dish washing and cooking, can easily result in humidity control problems and over cooling by conventional packaged rooftop units.

Churches — Like schools, the high degree of variable occupancy and ventilation requirements can result in humidity control problems and over cooling situations by a conventional packaged rooftop unit.

Humid Climates — In climates along the coast, when the temperature drops, the outdoor wet bulb temperature may remain the same or higher. This results in a need to reduce the sensible capacity but yet provide more latent capacity to prevent humidity levels from increasing in the space.

Unique Operation of the Perfect Humidity

Perfect Humidity = Stages of comfort control

Choosing Bryant for your comfort means putting your trust in a company with over one hundred years of leadership in the heating and cooling industry. We’re proud of our past, and are continuously looking for ways to provide the products that meet your current and future needs. Combining proven comfort technology with economical operation and warranty protection, Bryant light commercial systems can be the key to affordable comfort for years to come.

One of the reasons we have remained successful during the past century is our nationwide network of Bryant dealers. Your local dealer can design, install and maintain your system for peak performance, money-saving efficiency and quiet indoor comfort throughout every season. Ask your Bryant dealer to help you create a system that offers dependable, worry-free comfort year after year.

Perfect Humidity™ with Hot Gas Reheat
Dehumidification For Packaged Rooftop Units
Benefits include:

- Maintaining indoor space humidity levels can be increasingly difficult depending on the time of year, location of the installation, and the ability of the equipment to provide reliable, flexible operation to meet indoor part load sensible and latent load requirements. Standard rooftop performance often cannot meet these variable requirements, as the unit’s sensible heat ratio is typically fixed and the unit is generally controlled from sensible loads only via a thermostat.

- Bryant’s Perfect Humidity™ with Hot Gas Reheat system is an all-inclusive factory installed option, available on most Bryant light commercial rooftop units. It meets the demand for a cost effective, yet flexible and high performing solution to these humidity and part load issues.

The innovative Perfect Humidity with Hot Gas Reheat system expands the envelope of operation of Bryant’s unitary rooftop products to provide unprecedented flexibility in year round comfort conditions.

Features & Benefits

**Superior Humidity Control** — Using compressors for active dehumidification, the system can boost the latent capacity of the standard rooftop unit by up to 40%, in the sub-cooling mode, and still allow the capability for dehumidification without a call for cooling, when required by the space.

**Factory Installed & Warranted** — The Perfect Humidity with Hot Gas Reheat system is a factory designed, tested and installed option, specifically engineered for optimum performance and reliability with Bryant rooftop units. The Perfect Humidity system is backed by the rooftop unit’s factory warranty.

**Consistent Comfort** — System flexibility allows the rooftop unit to maintain both indoor temperature and humidity comfort conditions consistently year round.

**Maximum Flexibility** — Using three operational modes for each circuit, the system is better able to adapt to peak and part load outdoor temperature and humidity conditions. This results in up to 35% more moisture removal capability than typical conventional hot gas reheat systems, and the ability to operate without any restrictions on the unit’s normal airflow range.

**Cost Effective** — Available as a factory installed option on most light commercial rooftop products, the Perfect Humidity, with Hot Gas Reheat system provides a cost effective packaged alternative for meeting latent load intensive applications and variable SHR requirements. System installation costs are simplified and minimized by using Bryant’s exclusive light commercial Thermidistat™ or a humidistat device with a thermostat for combined temperature and humidity sensing in the space.

**Sub-Cooling Mode**

During part load conditions when the room temperature and humidity are above the setpoint, the unit will initiate the sub-cooling mode of operation; a call for cooling and dehumidification.

In this mode, the liquid refrigerant leaves the condenser and is routed through the Perfect Humidity coil, downstream of the condenser, and then through the evaporator. The indoor air stream passes over the evaporator first then over the Perfect Humidity coil, further sub-cooling the refrigerant. This highly sub-cooled refrigerant is then fed to the evaporator coil, creating a colder evaporator coil surface. At the same time, the air leaving the evaporator is partially reheated to prevent overheating of the space.

Because the supply air temperature is approximately 5 to 7 degrees higher than normal supply air temperatures, the end result is a conditioned space that is cooled and significantly more dehumidified, but not over-cooled. This additional mode of operation also helps eliminate short cycling of the rooftop unit and improves space temperature and humidity control.

**Hot Gas Reheat Mode**

When there is a call for dehumidification without a call for cooling, a portion of the hot gas from the compressor bypasses the condenser coil and is fed into the liquid line. At this point, it is mixed with the sub-cooled refrigerant leaving the condenser coil.

This two-phase mixture is routed through the Perfect Humidity coil and then the evaporator. Additional sub-cooling of the refrigerant occurs in the Perfect Humidity coil, and when this refrigerant is fed into the evaporator, the result is a colder coil surface.

The air is cooled and dehumidified as it flows across the evaporator. It is then reheated to neutral conditions by the Perfect Humidity coil.
