NOTE: Read the entire instruction manual before starting the installation.

NOTE: This furnace can be installed as a direct vent (2-pipe) or non-direct vent (1-pipe) condensing gas furnace.

This symbol → indicates a change since the last issue.

## SAFETY CONSIDERATIONS

### CAUTION: FURNACE RELIABILITY HAZARD
Improper installation or misapplication of furnace may require excessive servicing or cause premature component failure.
Application of this furnace should be indoors with special attention given to vent sizing and material, gas input rate, air temperature rise, unit leveling, and unit sizing.

### WARNING: FIRE, EXPLOSION, ELECTRICAL SHOCK AND CARBON MONOXIDE POISONING HAZARD
Failure to follow this warning could result in electrical shock, fire, personal injury, or death.
Improper installation, adjustment, alteration, service, maintenance, or use can cause carbon monoxide poisoning, explosion, fire, electrical shock, or other conditions which may cause personal injury or property damage. Consult a qualified installer, service agency, local gas supplier, or your distributor or branch for information or assistance. The qualified installer or agency must use only factory-authorized and listed kits or accessories when modifying this product.

Installing and servicing heating equipment can be hazardous due to gas and electrical components. **Only trained and qualified personnel should install, repair, or service heating equipment.** Untrained personnel can perform basic maintenance functions such as cleaning and replacing air filters. All other operations must be performed by trained service personnel. When working on heating equipment, observe precautions in literature, on tags, and on labels attached to or shipped with unit and other safety precautions that may apply.

These instructions cover the minimum requirements and conform to existing national standards and safety codes. In some instances, these instructions exceed certain local codes and ordinances, especially those that may not have kept up with changing residential construction practices. We require these instructions as a minimum for a safe installation.

Wear safety glasses and work gloves.

### CAUTION: CUT HAZARD
Sheet metal parts may have sharp edges or burrs. Use care and wear appropriate protective clothing and gloves when handling parts.

Have a fire extinguisher available during start-up and adjustment procedures and service calls.
Recognize safety information. This is the safety-alert symbol ▲. When you see this symbol on the unit and in instructions or manuals, be alert to the potential for personal injury.
Understand these signal words: DANGER, WARNING, and CAUTION. These words are used with the safety-alert symbol. DANGER identifies the most serious hazards which will result in severe personal injury or death. WARNING signifies hazards which could result in personal injury or death. CAUTION is used to identify unsafe practices which may result in minor personal injury or product and property damage. NOTE is used to highlight suggestions which will result in enhanced installation, reliability, or operation.
The model 352AAV, 2-Stage, 4-way multipoise, Gas-Fired, Category IV, condensing furnace is available in model sizes ranging in high-stage gas input rates of 60,000 to 120,000 Btuh. This furnace is CSA (formerly AGA and CGA) design-certified for natural and propane gases (see furnace rating plate) and for installation in alcoves, attics, basements, closets, utility rooms, crawlspaces, and garages. This furnace is factory-shipped for use with natural gas. A CSA listed gas conversion kit is required to convert furnace for use with propane gas.

See Fig. 3 for required clearances to combustibles. This furnace SHALL NOT be installed directly on carpeting, tile, or any other combustible material other than wood flooring. For downflow installations, a factory accessory floor base must be used when installed on combustible materials and wood flooring. Special base is not required when this furnace is installed on the manufacturer’s coil assembly or when the manufacturer’s coil box is used. The design of the 352AAV furnace is not CSA certified for installation in mobile homes, recreational vehicles, or outdoors. This furnace is suitable for installation in a structure built on site or a manufactured building completed at final site. This furnace is designed for continuous return-air minimum temperature of 60°F db or intermittent operation down to 55°F db such as when used with a night setback thermostat. Return-air temperature must not exceed 80°F db. Failure to follow these return air limits may affect reliability of heat exchangers, motors and controls. (See Fig. 4.) This furnace is shipped with the drain and pressure tubes connected for **UPFLOW** applications. Minor modifications are required when used in **DOWNFLOW, HORIZONTAL RIGHT, or HORIZONTAL LEFT** (supply-air discharge direction) applications as shown in Fig. 1. See details in Applications section.
Install this furnace only in a location and position as specified in LOCATION and INSTALLATION sections of these instructions.
Always provide adequate combustion and ventilation air as specified in section Combustion Air and Vent Pipe Systems of these instructions to furnace. Combustion products must be discharged outdoors. Connect this furnace to an approved vent system only, as specified in the Combustion Air and Vent Piping sections of these instructions. Never test for gas leaks with an open flame. Use a commercially available soap solution made specifically for the detection of leaks to check all connections, as specified in the GAS PIPING section of these instructions. Always install furnace to operate within the furnace’s intended rise range with a duct system which has an external static pressure within the allowable range, as specified in the SET TEMPERATURE RISE section of these instructions and furnace rating plate. When a furnace is installed so that supply ducts carry air circulated by the furnace to areas outside the space containing the furnace, the return air shall also be handled by duct(s) sealed to the furnace casing and terminating outside the space containing the furnace.
A gas-fired furnace for installation in a residential garage must be installed as specified in the Hazardous Locations section of these instructions.

The furnace may be used for construction heat provided that the furnace installation and operation complies with:

- The furnace is permanently installed with all electrical wiring, piping, air filters, venting and ducting installed according to these installation instructions. A return air duct is provided, sealed to the furnace casing, and terminated outside the space containing the furnace. This prevents a negative pressure condition as created by the circulating air blower, causing a flame rollout and/or drawing combustion products into the structure.
- The filters used to clean the circulating air during the construction process must be either changed or thoroughly cleaned prior to occupancy.
- The furnace, ductwork and filters are cleaned as necessary to minimize the corrosive effects of adhesives, sealers and other construction materials. It also prevents the entrainment of drywall dust into combustion air, which can cause fouling and plugging of furnace components.
- The temperature of the return air to the furnace is maintained between 55°F (13°C) and 80°F (27°C), with no evening setback or shutdown. The use of the furnace while the structure is under construction is deemed to be intermittent operation per our installation instructions.
- The air temperature rise is within the rated rise range on the furnace rating plate, and the firing rate has been set to the nameplate value.
- The filters used to clean the circulating air during the construction process must be either changed or thoroughly cleaned prior to occupancy.
- The air temperature rise is within the rated rise range on the furnace rating plate, and the firing rate has been set to the nameplate value.

This furnace is shipped with the following materials to assist in proper furnace installation. These materials are shipped in the main blower compartment.

* ONLY supplied with some furnaces.

The furnace shall be installed so that the electrical components are protected by water.

For accessory installation detail, refer to the accessory installation instruction.

NOTE: Remove all shipping materials before operating furnace.

---

**CODES AND STANDARDS**

Follow all national and local codes and standards in addition to these instructions. The installation must comply with regulations of the serving gas supplier, local building, heating, plumbing, and other codes. In absence of local codes, the installation must comply with the national codes listed below and all authorities having jurisdiction.

In the United States and Canada, follow all codes and standards for the following:

**I. SAFETY**
- CANADA: National Standard of Canada, Natural Gas and Propane Installation Code (NSCNGPIC) CSA B149.1-05

**II. GENERAL INSTALLATION**
- US: NFGC and the NFPA 90B. For copies, contact the National Fire Protection Association Inc., Batterymarch Park, Quincy, MA 02269; or for only the NFGC contact the American Gas Association, 400 N. Capitol, N.W., Washington DC 20001
- A manufactured (Mobile) home installation must conform with the Manufactured Home Construction and Safety Standard, Title 24 CFR, Part 3280, or when this standard is not applicable, the Standard for Manufactured Home Installation (Manufactured Home Sites, Communities, and Set-Ups), ANSI/NCS A225.1, and/or CAN/CSA-Z240, MH Series Mobile Homes
- CANADA: NSCNGPIC. For a copy, contact Standard Sales, CSA International, 178 Rexdale Boulevard, Etobicoke (Toronto), Ontario, M9W 1R3, Canada.

**III. COMBUSTION AND VENTILATION AIR**
- US: Section 8.3 of the NFGC, Air for Combustion and Ventilation
- CANADA: Part 7 of the NSCNGPIC, Venting Systems and Air Supply for Appliances

**IV. DUCT SYSTEMS**

**V. ACOUSTICAL LINING AND FIBROUS GLASS DUCT**
- US and CANADA: current edition of SMACNA, NFPA 90B as tested by UL Standard 181 for Class I Rigid Air Ducts

**VI. GAS PIPING AND GAS PIPE PRESSURE TESTING**
- US: NFGC; chapters 5, 6, 7, and 12 and national plumbing codes
- CANADA: NSCNGPIC Parts 3, 4, 5, A, B, E, G, and H.
- In the state of Massachusetts:
  - This product must be installed by a licensed plumber or gas fitter.
  - When flexible connectors are used, the maximum length shall not exceed 36 inches.
  - When lever type gas shutoffs are used they shall not exceed 36 inches.
  - The use of copper tubing for gas piping is not approved by the state of Massachusetts.

**VII. ELECTRICAL CONNECTIONS**
- CANADA: Canadian Electrical Code CSA C22.1
Fig. 2—Dimensional Drawing

NOTES:
1. Minimum return-air openings at furnace, based on metal duct. If flex duct is used, see flex duct manufacturer's recommendations for equivalent diameters.
2. Minimum return-air opening at furnace:
   a. For 800 CFM—16-in. round or 14 1/2 x 12-in. rectangle.
   b. For 1200 CFM—20-in. round or 14 1/2 x 19 1/2-in. rectangle.
   c. For 1600 CFM—22-in. round or 14 1/2 x 23 1/4-in. rectangle.
   d. For airflow requirements above 1800 CFM, see Air Delivery table in Product Data literature for specific use of single side inlets. The use of both side inlets, a combination of 1 side and the bottom, or the bottom only will ensure adequate return air openings for airflow requirements above 1800 CFM at 0.5" W.C. ESP.

**ELECTROSTATIC DISCHARGE (ESD) PRECAUTIONS**

**CAUTION: UNIT DAMAGE HAZARD**

Failure to follow this caution may result in damage to unit components.

Electrostatic discharge can affect electronic components. Take precautions during furnace installation and servicing to protect the furnace electronic control. Precautions will prevent electrostatic discharges from personnel and hand tools which are held during the procedure. These precautions will help to avoid exposing the control to electrostatic discharge by putting the furnace, the control, and the person at the same electrostatic potential.

1. Disconnect all power to the furnace. Multiple disconnects may be required. DO NOT TOUCH THE CONTROL OR ANY WIRE CONNECTED TO THE CONTROL PRIOR TO DISCHARGING YOUR BODY’S ELECTROSTATIC CHARGE TO GROUND.

2. Firmly touch the clean, unpainted, metal surface of the furnace chassis which is close to the control. Tools held in hand during grounding will be discharged.

3. After touching the chassis, you may proceed to service the furnace, using a clean unpainted metal surface of the furnace again before touching the control or wires.

4. If you touch ungrounded objects, firmly touch a clean, unpainted metal surface of the furnace again before touching control or wires.

5. Use this procedure for installed and uninstalled (ungrounded) furnaces.
6. Before removing a new control from its container, discharge your body’s electrostatic charge to ground to protect the control from damage. If the control is to be installed in a furnace, follow items 1 through 4 before bringing the control or yourself in contact with the furnace. Put all used and new controls into containers before touching ungrounded objects.

7. An ESD service kit (available from commercial sources) may also be used to prevent ESD damage.

INTRODUCTION

The model 352AAV 4-way multipoise, Gas-Fired, Category IV, condensing furnace is available in model sizes ranging from input capacity of 60,000 to 120,000 Btuh as a direct vent (2-pipe) application as well as a non-direct vent (1-pipe) application.

APPLICATIONS

I. GENERAL

Some assembly and modifications are required for furnaces installed in any of the 4 applications shown in Fig. 1. All drain and pressure tubes are connected as shown in Fig. 6. See appropriate application instructions for these procedures.

II. UPFLOW APPLICATIONS

In an upflow application, the blower is located below the burner section, and conditioned air is discharged upwards.

A. Condensate Trap Location (Factory-Shipped Orientation)

The condensate trap is factory installed in the blower shelf and factory connected for UPFLOW applications. A factory-supplied tube is used to extend the condensate trap drain connection to the desired furnace side for field drain attachment. See Condensate Trap Tubing (Factory-Shipped Orientation) section for drain tube extension details. (See Fig. 5.)

B. Condensate Trap Tubing (Factory-Shipped Orientation)

NOTE: See Fig. 6 or tube routing label on main furnace door to confirm location of these tubes.

1. Collector Box Drain, Inducer Housing Drain, Relief Port, and Pressure Switch Tubes

These tubes should be factory attached to condensate trap and pressure switch ready for use in upflow applications. These tubes can be identified by their connection location and also by a color label on each tube. These tubes are identified as follows: collector box drain tube (blue label), inducer housing drain tube (violet label or molded), relief port tube (green label), and pressure switch tube (pink label).

2. Condensate Trap Drain Tube

The condensate trap drain connection must be extended for field attachment by doing the following:

a. Determine location of field drain connection. (See Fig. 2 or 6.)

NOTE: If internal filter or side Filter/Media Cabinet is used, drain tube should be located to opposite side of casing from return duct attachment to assist in filter removal.

b. Remove and discard casing drain hole plug button from desired side.

c. Install drain tube coupling grommet (factory-supplied in loose parts bag) in selected casing hole.

d. Slide drain tube coupling (factory-supplied in loose parts bag) through grommet ensuring long end of coupling faces blower.

e. Cement 2 factory-supplied 1/2-in. street CPVC elbows to the rigid drain tube connection on the condensate trap. (See Fig. 6.) These elbows must be cemented together and cemented to condensate trap drain connection.

NOTE: Failure to use CPVC elbows may allow drain to kink and prevent draining.

f. Connect larger diameter drain tube and clamp (factory-supplied in loose parts bag) to condensate trap and clamp securely.

g. Route tube to coupling and cut to appropriate length.

h. Attach tube to coupling and clamp securely.

C. Condensate Trap Location (Alternate Upflow Orientation)

An alternate location for the condensate trap is the left-hand side of casing. (See Fig. 2 and 7.)

NOTE: If the alternate left-hand side of casing location is used, the factory-connected drain and relief port tubes must be disconnected and modified for attachment. See Condensate Trap Tubing (Alternate Upflow Orientation) section for tubing attachment. To relocate condensate trap to the left-hand side, perform the following:

1. Remove 3 tubes connected to condensate trap.

2. Remove trap from blower shelf by gently pushing tabs inward and rotating trap.

3. Install casing hole filler cap (factory-supplied in loose parts bag) into blower shelf hole where trap was removed.

WARNING: CARBON MONOXIDE POISONING HAZARD

Failure to follow this warning could result in personal injury or death.

Casing hole filler cap must be installed in blower shelf hole when condensate trap is relocated to prevent combustion products being drawn in from appliances in the equipment room.

4. Install condensate trap into left-hand side casing hole by inserting tube connection stubs through casing hole and rotating until tabs snap into locking position.
5. Fill unused condensate trap casing holes with plastic filler caps (factory-supplied in loose parts bag).

D. Condensate Trap Tubing (Alternate Upflow Orientation)

NOTE: See Fig. 7 or tube routing label on main furnace door to confirm location of these tubes.

1. Collector Box Drain Tube
   Connect collector box drain tube (blue label) to condensate trap.

NOTE: On 17-1/2 in. wide furnaces ONLY, cut tube between corrugated sections to prevent kinks from occurring.

2. Inducer Housing Drain Tube
   a. Remove and discard LOWER (molded) inducer housing drain tube which was previously connected to condensate trap.
   b. Use inducer housing drain extension tube (violet label and factory-supplied in loose parts bag) to connect LOWER inducer housing drain connection to the condensate trap.
   c. Determine appropriate length, cut, and connect tube.
   d. Clamp tube to prevent any condensate leakage.

3. Relief Port Tube
   a. Connect relief port tube (green label) to condensate trap.
   b. Extend this tube (if required) by splicing to small diameter tube (factory-supplied in loose parts bag).
   c. Determine appropriate length, cut, and connect tube.

E. Condensate Trap Field Drain Attachment

Refer to Condensate Drain section for recommendations and procedures.

F. Pressure Switch Tubing

The LOWER collector box pressure tube (pink label) is factory connected to the High Pressure Switch and should not require any modification.

NOTE: See Fig. 6 or 7 or tube routing label on main furnace door to check for proper connections.

G. Upper Collector Box and Inducer Housing (Unused) Drain Connections

UPPER COLLECTOR BOX DRAIN CONNECTION

Attached to the UPPER collector box drain connection is a factory-installed corrugated, plugged tube (blue and white striped label). This tube is plugged to prevent condensate leakage in this application. Ensure this tube is plugged.

NOTE: See Fig. 6 or 7 or tube routing label on main furnace door to check for proper connections.

UPPER INDUCER HOUSING DRAIN CONNECTION

Attached to the UPPER (unused) inducer housing drain connection is a cap and clamp. This cap is used to prevent condensate leakage in this application. Ensure this connection is capped.

NOTE: See Fig. 6 or 7 or tube routing label on main furnace door to check for proper connections.

H. Condensate Trap Freeze Protection

Refer to Condensate Drain Protection section for recommendations and procedures.
III. DOWNFLOW APPLICATIONS

In a downflow furnace application, the blower is located above the burner section, and conditioned air is discharged downwards.

A. Condensate Trap Location

The condensate trap must be removed from the factory-installed blower shelf location and relocated in selected application location as shown in Fig. 2, 8, or 9.

To relocate condensate trap from the blower shelf to desired location, perform the following:

1. Remove 3 tubes connected to condensate trap.
2. Remove trap from blower shelf by gently pushing tabs inward and rotating trap.
3. Remove casing hole filler cap from casing hole. (See Fig. 2, 8, or 9.)
4. Install casing hole filler cap into blower shelf hole where trap was removed.

B. Condensate Trap Tubing

NOTE: See Fig. 8 or 9 or tube routing label on main furnace door to check for proper connections.

Relocate tubes as described below.

1. Collector Box Drain Tube
   a. Remove factory-installed plug from LOWER collector box drain tube (blue and white striped label).
   b. Install removed clamp and plug into UPPER collector box drain tube (blue label) which was connected to condensate trap.
   c. Connect LOWER collector box drain connection to condensate trap.

   1. Condensate Trap Located on Left Side of Casing
      a. Connect LOWER collector box drain tube (blue and white striped label) to condensate trap. Tube does not need to be cut.
      b. Clamp tube to prevent any condensate leakage.
Fig. 8—Downflow Tube Configuration
(Left-Hand Trap Installation)
(a.) Install drain tube coupling (factory-supplied in loose parts bag) into collector box drain tube (blue and white striped label) which was previously plugged.
(b.) Connect larger diameter drain tube (factory-supplied in loose parts bag) to drain tube coupling, extending collector box drain tube for connection to condensate trap.
(c.) Route extended collector box drain tube directly from collector box drain to condensate trap as shown in Fig. 9.
(d.) Determine appropriate length and cut.
(e.) Connect to condensate trap.
(f.) Clamp tube to prevent any condensate leakage.

2. Inducer Housing Drain Tube
   a. Remove factory-installed cap and clamp from LOWER inducer housing drain connection.
   b. Remove and discard UPPER (molded) inducer housing drain tube which was previously connected to condensate trap.
   c. Install cap and clamp on UPPER inducer housing drain connection where molded drain tube was removed.
   d. Use inducer housing drain tube (violet label and factory-supplied in loose parts bag) to connect LOWER inducer housing drain connection to the condensate trap.
   e. Connect inducer housing drain connection to condensate trap.
   (1.) Condensate Trap Located on Left Side of Casing
       (a.) Determine appropriate length and cut.
       (b.) Connect tube to condensate trap.

3. Relief Port Tube
   Refer to Pressure Switch Tubing section for connection procedure.

C. Condensate Trap Field Drain Attachment
Refer to Condensate Drain section for recommendations and procedures.

D. Pressure Switch Tubing
One collector box pressure tube (pink label) is factory connected to the High Pressure Switch for use when furnace is installed in upflow applications. This tube MUST be disconnected and used for the condensate trap relief port tube. The other collector box pressure tube (green label) which was factory connected to the condensate trap relief port connection MUST be connected to the High Pressure Switch in DOWNFLOW or HORIZONTAL RIGHT applications NOTE: See Fig. 8 or 9 or tube routing label on main furnace door to check for proper connections.

1. Disconnect collector box pressure tube (pink label) attached to High Pressure Switch.
2. Extend collector box pressure tube (green label) which was previously connected to condensate trap relief port connection by splicing to small diameter tube (factory-supplied in loose parts bag).
3. Connect collector box pressure tube (green label) to High Pressure Switch connection labeled COLLECTOR BOX.
4. Extend collector box pressure tube (pink label) which was previously connected to High Pressure Switch by splicing to remaining small diameter tube (factory-supplied in loose parts bag).

5. Route this extended tube (pink label) to condensate trap relief port connection.

6. Determine appropriate length, cut, and connect tube.

7. Clamp tube to relief port connection.

E. Condensate Trap Freeze Protection

Refer to Condensate Drain Protection section for recommendations and procedures.

IV. HORIZONTAL LEFT (SUPPLY-AIR DISCHARGE) APPLICATIONS

In a horizontal left furnace application, the blower is located to the right of the burner section, and conditioned air is discharged to the left.

A. Condensate Trap Location

The condensate trap must be removed from the factory-installed blower shelf location and relocated in selected application location as shown in Fig. 2 or 10.

To relocate condensate trap from the blower shelf to desired location, perform the following:

1. Remove 3 tubes connected to condensate trap.

2. Remove trap from blower shelf by gently pushing tabs inward and rotating trap.

3. Install casing hole filler cap (factory-supplied in loose parts bag) into blower shelf hole where trap was removed.

WARNING: CARBON MONOXIDE POISONING HAZARD

Failure to follow this warning could result in personal injury or death.

Casing hole filler cap must be installed in blower shelf hole when condensate trap is relocated to prevent combustion products being drawn in from appliances in the equipment room.

4. Install condensate trap into left-hand side casing hole by inserting tube connection stubs through casing hole and rotating until tabs snap into locking position.

5. Fill unused condensate trap casing holes with plastic filler caps (factory-supplied in loose parts bag).

B. Condensate Trap Tubing

NOTE: See Fig. 10 or tube routing label on main furnace door to check for proper connections.

1. Collector Box Drain Tube

a. Install drain tube coupling (factory-supplied in loose parts bag) into collector box drain tube (blue label) which was previously connected to condensate trap.

b. Connect large diameter drain tube and clamp (factory-supplied in loose parts bag) to drain tube coupling, extending collector box drain tube.

c. Route extended tube (blue label) to condensate trap and cut to appropriate length.

d. Clamp tube to prevent any condensate leakage.
2. Inducer Housing Drain Tube
   a. Remove and discard LOWER (molded) inducer housing drain tube which was previously connected to condensate trap.
   b. Use inducer housing drain extension tube (violet label and factory-supplied in loose parts bag) to connect LOWER inducer housing drain connection to the condensate trap.
   c. Determine appropriate length, cut, and connect tube.
   d. Clamp tube to prevent any condensate leakage.

3. Relief Port Tube
   a. Extend collector box tube (green label) which was previously connected to the condensate trap by splicing to small diameter tube (factory-supplied in loose parts bag).
   b. Route extended collector box pressure tube to relief port connection on the condensate trap.
   c. Determine appropriate length, cut, and connect tube.
   d. Clamp tube to prevent any condensate leakage.

C. Condensate Trap Field Drain Attachments
   Refer to Condensate Drain section for recommendations and procedures.

D. Pressure Switch Tubing
   The LOWER collector box pressure tube (pink label) is factory connected to the High Pressure Switch for use when furnace is installed in UPFLOW applications. This tube MUST be disconnected, extended, rerouted, and then reconnected to the pressure switch in HORIZONTAL LEFT applications for 060 and 080 heating input furnaces.

   NOTE: See Fig. 10 or tube routing label on main furnace door to check for proper connections.

   Modify tube as described below:
   1. Disconnect collector box pressure tube (pink label) attached to High Pressure Switch.
   2. Use smaller diameter tube (factory-supplied in loose parts bag) to extend tube disconnected in item 1.
   3. Route extended tube:
      a. Behind inducer housing.
      b. Between blower shelf and inducer housing.
   4. Determine appropriate length, cut, and reconnect tube to High Pressure Switch connection labeled COLLECTOR BOX.

E. Condensate Trap Freeze Protection
   Refer to Condensate Drain Protection section for recommendations and procedures.

F. Construct a Working Platform
   Construct working platform where all required furnace clearances are met. (See Fig. 3 and 11 or 12.)

   NOTE: Combustion-air and vent pipes are restricted to a minimum length of 5 ft. (See Table 12.)
NOTE: A 12-in. minimum offset pipe section is recommended with short (5 to 8 ft) vent systems. This recommendation is to reduce excessive condensate droplets from exiting the vent pipe. (See Fig. 11, 12 or 43.)

V. HORIZONTAL RIGHT (SUPPLY-AIR DISCHARGE) APPLICATIONS

In a horizontal right furnace application, the blower is located to the left of the burner section, and conditioned air is discharged to the right.

CAUTION: MINOR PROPERTY DAMAGE

Failure to follow this caution may result in minor property damage.

Local codes may require a drain pan under entire furnace and condensate trap when a condensing furnace is installed above finished ceilings.

NOTE: The auxiliary junction box (J-Box) MUST be relocated to opposite side of furnace casing. (See Fig. 13.) See Electrical Connection section for J-Box relocation.

A. Condensate Trap Location

The condensate trap must be removed from the factory-installed blower shelf location and relocated in selected application location as shown in Fig. 2 or 13.

To relocate condensate trap from the blower shelf to desired location, perform the following:

1. Remove 3 tubes connected to condensate trap.
2. Remove trap from blower shelf by gently pushing tabs inward and rotating trap.
3. Install casing hole filler cap (factory-supplied in loose parts bag) into blower shelf hole where trap was removed.

NOTE: Local codes may require a drain pan under the furnace and condensate trap when a condensing furnace is installed above finished ceilings.

CAUTION: MINOR PROPERTY DAMAGE

Failure to follow this caution may result in minor property damage.

NOTE: See Fig. 13 or tube routing label on main furnace door to check for proper connections.

1. Collector Box Drain Tube:
   a. Remove factory-installed plug from LOWER collector box drain tube (blue and white striped label).
   b. Install removed clamp and plug into UPPER collector box drain tube (blue label) which was previously connected to condensate trap.
   c. Connect LOWER collector box drain tube (blue and white striped label) to condensate trap. Tube does not need to be cut.
   d. Clamp tube to prevent any condensate leakage.

2. Inducer Housing Drain Tube:
   a. Remove factory-installed cap and clamp from LOWER inducer housing drain connection.
b. Remove and discard UPPER (molded) inducer housing drain tube which was previously connected to condensate trap.

c. Install cap and clamp on UPPER inducer housing drain connection where molded drain tube was removed.

d. Use inducer housing drain extension tube (violet label and factory-supplied in loose parts bag) to connect LOWER inducer housing drain connection to condensate trap.

e. Determine appropriate length, cut, and connect tube to condensate trap.

f. Clamp tube to prevent any condensate leakage.

3. Relief Port Tube:
   Refer to Pressure Switch Tubing section for connection procedure.

C. Condensate Trap Field Drain Attachment
Refer to Condensate Drain section for recommendations and procedures.

D. Pressure Switch Tubing
One collector box pressure tube (pink label) is factory connected to the High Pressure Switch for use when furnace is installed in UPFLOW applications. This tube MUST be disconnected and used for the condensate trap relief port tube. The other collector box pressure tube (green label) which was factory connected to the condensate trap relief port connection MUST be connected to the High Pressure Switch in DOWNFLOW or HORIZONTAL RIGHT applications.

NOTE: See Fig. 12 or tube routing label on main furnace door to check for proper connections.
Relocate tubes as described below.

1. Disconnect collector box pressure tube (pink label) attached to High Pressure Switch.

2. Extend collector box pressure tube (green label) which was previously connected to condensate trap relief port connection by splicing to small diameter tube (factory-supplied in loose parts bag).

3. Connect collector box pressure tube (green label) to High Pressure Switch connection labeled COLLECTOR BOX.

4. Use remaining smaller diameter tube (factory-supplied in loose parts bag) to extend collector box pressure tube (pink label) which was previously connected to High Pressure Switch. Route this extended tube (pink label) to condensate trap relief port connection.

5. Determine appropriate length, cut, and connect tube.

6. Clamp tube to relief port connection.

E. Condensate Trap Freeze Protection
Refer to Condensate Drain Protection section for recommendations and procedures.

F. Construct a Working Platform
Construct working platform where all required furnace clearances are met. (See Fig. 3 and 11 or 12.)

CAUTION: UNIT MAY NOT OPERATE
Failure to follow this caution may result in intermittent unit operation.
The condensate trap MUST be installed below furnace. See Fig. 5 for dimensions. The drain connection to condensate trap must also be properly sloped to an open drain.

NOTE: Combustion-air pipe (when applicable) and vent pipe(s) are restricted to a minimum length of 5 ft. (See Table 12.)

NOTE: A 12-in. minimum offset pipe section is recommended with short (5 to 8 ft) vent systems. This recommendation is to reduce excessive condensate droplets from exiting the vent pipe. (See Fig. 11, 12 or 43.)
LOCATION

I. GENERAL
This furnace must

- be installed so the electrical components are protected from water.
- not be installed directly on any combustible material other than wood flooring (refer to SAFETY CONSIDERATIONS).
- be located so combustion-air and vent pipe maximum lengths are not exceeded. Refer to Table 12.
- be located where available electric power and gas supplies meet specifications on the furnace rating plate.
- be attached to an air distribution system and be located as close to the center of the distribution system as possible. Refer to Air Ducts section.
- be provided with ample space for servicing and cleaning. Always comply with minimum fire protection clearances shown on the furnace clearance to combustibles label.

NOTE: For upflow/downflow applications install furnace so that it is level or pitched forward within 1/2-in. for proper furnace operation. For horizontal applications pitch 1/4-in. minimum to 1/2-in. maximum forward to ensure proper condensate drainage from secondary heat exchangers. (See Fig. 14.)

When a furnace is installed so that supply ducts carry air circulated by the furnace to areas outside the space containing the furnace, return air must also be handled by ducts sealed to furnace casing. The ducts terminate outside the space containing the furnace to ensure a negative pressure condition will not occur within equipment room or space.

WARNING: FIRE, INJURY OR DEATH HAZARD
Failure to follow this warning could result in fire, property damage, personal injury, or death. Do not install furnace on its back. (See Fig. 15.) Safety control operation will be adversely affected. Never connect return-air ducts to back of furnace.

II. FURNACE LOCATION RELATIVE TO COOLING EQUIPMENT
The cooling coil must be installed parallel with or on downstream side of furnace to avoid condensation in heat exchanger. When installed parallel with a furnace, dampers or other means used to control flow of air shall be adequate to prevent chilled air from entering furnace. If dampers are manually operated, they must be equipped with a means to prevent operation of either unit unless the damper is in full-heat or full-cool position.

CAUTION: UNIT DAMAGE HAZARD
This gas furnace may be used for construction heat provided that:
- The furnace is permanently installed with all electrical wiring, piping, air filters, venting and ducting installed according to these installation instructions. A return air duct is provided, sealed to the furnace casing, and terminated outside the space containing the furnace. This prevents a negative pressure condition as created by the circulating air blower, causing a flame rollout and/or drawing combustion products into the structure.
- The furnace is controlled by a thermostat. It may not be “hot wired” to provide heat continuously to the structure without thermostatic control.
- Clean outside air is provided for combustion. This is to minimize the corrosive effects of adhesives, sealers and other construction materials. It also prevents the entrainment of drywall dust into combustion air, which can cause fouling and plugging of furnace components.
- The temperature of the return air to the furnace is maintained between 55°F (13°C) and 80°F (27°C), with no evening setback or shutdown. The use of the furnace while the structure is under construction is deemed to be intermittent operation per our installation instructions.
- The air temperature rise is within the rated rise range on the furnace rating plate, and the firing rate has been set to the nameplate value.
- The filters used to clean the circulating air during the construction process must be either changed or thoroughly cleaned prior to occupancy.
- The furnace, ductwork and filters are cleaned as necessary to remove drywall dust and construction debris from all HVAC system components after construction is completed.
- After construction is complete, verify furnace operating conditions including ignition, input rate, temperature rise and venting, according to the manufacturer’s instructions.

CAUTION: UNIT DAMAGE HAZARD
Failure to follow this caution may result in minor property or unit damage.
If this furnace is installed in an unconditioned space where the ambient temperatures may be 32°F or lower, freeze protection measures must be taken. (See Fig. 16.)
III. HAZARDOUS LOCATIONS

WARNING: FIRE, EXPLOSION, INJURY OR DEATH HAZARD
Improper location or inadequate protection could result in fire or explosion.
When the furnace is installed in a residential garage, the burners and ignition sources must be located at least 18 in. above the floor. The furnace must be located or protected to avoid physical damage by vehicles. When the furnace is installed in a public garage, airplane hangar, or other building having a hazardous atmosphere, the furnace must be installed in accordance with the NFGC or NSCNGPIC. (See Fig. 17.)

→ IV. FURNACE LOCATION AND APPLICATION

A. Direct Vent (2-pipe) Application
Furnace may be located in a confined space without special provisions for dilution or ventilation air.

→ B. Non-Direct Vent (1-pipe) Application

CAUTION: UNIT DAMAGE HAZARD
Failure to follow this caution may result in intermittent unit operation.
Do not install furnace in a corrosive or contaminated atmosphere. Make sure all combustion and circulating air requirements are met.

Refer to the AIR FOR COMBUSTION AND VENTILATION section for details.

AIR FOR COMBUSTION AND VENTILATION
Provisions for adequate combustion, ventilation, and dilution air must be provided in accordance with:
• U.S. Installations: Section 8.3 of the NFGC, Air for Combustion and Ventilation and applicable provisions of the local building codes.
• Canadian Installations: Part 7 of the NSCNGPIC, Venting Systems and Air Supply for Appliances and all authorities having jurisdiction.

The following types of furnace installations may require OUT-DOOR AIR for combustion due to chemical exposures:
• Commercial buildings
• Buildings with indoor pools
• Laundry rooms
• Hobby or craft rooms, and
• Chemical storage areas
If air is exposed to the following substances, it should not be used for combustion air, and outdoor air may be required for combustion:
• Permanent wave solutions
• Chlorinated waxes and cleaners
• Chlorine based swimming pool chemicals
• Water softening chemicals
• De-icing salts or chemicals
• Carbon tetrachloride
• Halogen type refrigerants
• Cleaning solvents (such as perchloroethylene)
• Printing inks, paint removers, varnishes, etc.
• Hydrochloric acid
• Cements and glues
• Antistatic fabric softeners for clothes dryers
• Masonry acid washing materials

All fuel-burning equipment must be supplied with air for fuel combustion. Sufficient air must be provided to avoid negative pressure in the equipment room or space. A positive seal must be made between the furnace cabinet and the return-air duct to prevent pulling air from the burner area and from draft safeguard opening.
The requirements for combustion and ventilation air depend upon whether or not the furnace is located in a space having a volume of at least 50 cubic feet per 1,000 Btuh input rating for all gas appliances installed in the space.

- Spaces having less than 50 cubic feet per 1,000 Btuh require the OUTDOOR COMBUSTION AIR METHOD.
- Spaces having at least 50 cubic feet per 1,000 Btuh may use the INDOOR COMBUSTION AIR, STANDARD or KNOWN-AIR INFILTRATION METHOD.

**Outdoor Combustion Air Method**

1. Provide the space with sufficient air for proper combustion, ventilation, and dilution of flue gases using permanent horizontal or vertical duct(s) or opening(s) directly communicating with the outdoors or spaces that freely communicate with the outdoors.

2. Fig. 18 illustrates how to provide TWO OUTDOOR OPENINGS, one inlet and one outlet combustion and ventilation air openings to the outdoors.

   a. One opening MUST commence within 12" (300 mm) of the ceiling and the second opening MUST commence within 12" (300 mm) of the floor.

   b. Size openings and ducts per Fig. 18 and Table 1.

   c. TWO HORIZONTAL DUCTS require 1 square inch of free area per 2,000 Btuh (1,100 mm²/kW) of combined input for all gas appliances in the space per Fig. 18 and Table 1.

   d. TWO OPENINGS OR VERTICAL DUCTS require 1 square inch of free area per 4,000 Btuh (550 mm²/kW) for combined input of all gas appliances in the space per Fig. 18 and Table 1.

3. ONE OUTDOOR OPENING requires:

   a. 1 square inch of free area per 3,000 Btuh (734 mm²/kW) for combined input of all gas appliances in the space per Table 1 and

   b. Not less than the sum of the areas of all vent connectors in the space.

   The opening shall commence within 12" (300 mm) of the ceiling. Appliances in the space shall have clearances of at least 1" (25 mm) from the sides and back and 6" (150 mm) from the front. The opening shall directly communicate with the outdoors or shall communicate through a vertical or horizontal duct to the outdoors or spaces (crawl or attic) that freely communicate with the outdoors.

**Indoor Combustion Air® NFPA & AGA Standard and Known-Air-Infiltration Rate Methods**

Indoor combustion air is permitted for combustion, ventilation, and dilution, if the Standard or Known-Air-Infiltration Rate Method is used.

</table>
The **Standard** Method:
1. The space has no less volume than 50 cubic feet per 1,000 Btuh of the maximum input ratings for all gas appliances installed in the space and
2. The air infiltration rate is not known to be less than 0.40 air changes per hour (ACH).

The **Known Air Infiltration Rate** Method shall be used, if the infiltration rate is known to be:
1. Less than 0.40 ACH and
2. Equal to or greater than 0.10 ACH

Infiltration rates greater than 0.60 ACH shall not be used. The minimum required volume of the space varies with the number of ACH and shall be determined per Table 2 or Equations 1 and 2. Determine the minimum required volume for each appliance in the space and add the volumes together to get the total minimum required volume for the space.

**Table 2-Minimum Space Volumes** were determined by using the following equations from the National Fuel Gas Code ANSI Z223.1-2002/NFPA 54-2002, 8.3.2.2:

1. For other than fan-assisted appliances, such as a draft hood-equipped water heater:
   \[
   \text{Volume}_{\text{Other}} = \frac{2100}{\text{ACH}} \left( \frac{I_{\text{other}}}{1000 \text{ Btuh}} \right)
   \]

2. For fan-assisted appliances such as this furnace:
   \[
   \text{Volume}_{\text{Fan}} = \frac{1500}{\text{ACH}} \left( \frac{I_{\text{fan}}}{1000 \text{ Btuh}} \right)
   \]

If:
- \(I_{\text{other}}\) = combined input of all other than fan-assisted appliances in Btu/hr
- \(I_{\text{fan}}\) = combined input of all fan-assisted appliances in Btu/hr
- ACH = air changes per hour (ACH shall not exceed 0.60.)

The following requirements apply to the **Standard** Method and to the **Known Air Infiltration Rate** Method.
1. Adjoining rooms can be considered part of a space if:
   a. There are no closable doors between rooms.
   b. Combining spaces on same floor level. Each opening shall have free area of at least 1 in.\(^2\)/1,000 Btuh (2,000 mm\(^2\)/kW) of the total input rating of all gas appliances in the space, but not less than 100 in.\(^2\) (0.06 m\(^2\)). One opening shall commence within 12” (300 mm) of the ceiling and the second opening shall commence within 12” (300 mm) of the floor. The minimum dimension of air openings shall be at least 3 in. (80 mm). (See Fig. 19.)

2. An attic or crawlspace may be considered a space that freely communicates with the outdoors provided there are adequate permanent ventilation openings directly to outdoors having free area of at least 1-in.\(^2\)/4,000 Btuh of total input rating for all gas appliances in the space.

3. In spaces that use the **Indoor Combustion Air** Method, infiltration should be adequate to provide air for combustion, permanent ventilation and dilution of flue gases. However, in buildings with unusually tight construction, additional air **MUST** be provided using the methods described in the **Outdoor Combustion Air** Method section.

**Combination of Indoor and Outdoor Air**
1. Indoor openings shall comply with the **Indoor Combustion Air** Method below and,
2. Outdoor openings shall be located as required in the **Outdoor Combustion Air** Method mentioned previously and,
3. Outdoor openings shall be sized as follows:
   a. Calculate the Ratio of all Indoor Space volume divided by required volume for **Indoor Combustion Air** Method below.
   b. Outdoor opening size reduction **Factor** is 1 minus the Ratio in a. above.
   c. Minimum size of Outdoor openings shall be the size required in **Outdoor Combustion Air** Method above multiplied by reduction **Factor** in b. above. The minimum dimension of air openings shall be not less than 3 in. (80 mm).

**INSTALLATION**

**I. LEVELING LEGS (IF DESIRED)**

When furnace is used in upflow position with side inlet(s), leveling legs may be desired. (See Fig. 20.) Install field-supplied, corrosion-resistant 5/16-in. machine bolts and nuts.
1. Position furnace on its back. Locate and drill a 5/16-in. diameter hole in each bottom corner of furnace. (See Fig. 20.) Holes in bottom closure panel may be used as guide locations.

2. For each hole, install nut on bolt and then install bolt and nut in hole. (Install flat washer if desired.)

3. Install another nut on other side of furnace base. (Install flat washer if desired.)

4. Adjust outside nut to provide desired height, and tighten inside nut to secure arrangement.

**NOTE:** Bottom closure must be used when leveling legs are used. See Bottom Closure Panel section.

### II. INSTALLATION IN UPFLOW AND DOWNFLOW APPLICATIONS

**NOTE:** For downflow applications, this furnace is approved for use on combustible flooring when special base (available from manufacturer) Part No. KGASB0201ALL is used. Special base is not required when this furnace is installed on manufacturer’s Coil Assembly Part No. CD5 or CK5, or Coil Box Part No. KCAKC is used.

1. Determine application being installed from Table 3.

2. Construct hole in floor per dimensions specified in Table 3 and Fig. 21.

3. Construct plenum to dimensions specified in Table 3 and Fig. 21.

4. If downflow subbase (KGASB) is used, install as shown in Fig. 22. If Coil Assembly Part No. CD5 or CK5 or Coil Box Part No. KCAKC is used, install as shown in Fig. 23.

**NOTE:** Remove furnace perforated, supply-air duct flanges when they interfere with mating flanges on coil or downflow subbase. To remove perforated, supply-air duct flanges, use wide duct pliers, duct flange tool, or hand seamers to bend flange back and forth until it breaks off. Be careful of sharp edges. (See Fig. 24.)

</tbody>
</table>
When a furnace is installed so that the supply ducts carry air circulated by the furnace to areas outside the space containing the furnace, the return air must also be handled by a duct(s) sealed to the furnace casing and terminating outside the space containing the furnace.

Secure ductwork with proper fasteners for type of ductwork used. Seal supply- and return-duct connections to furnace with code approved tape or duct sealer.

Flexible connections should be used between ductwork and furnace to prevent transmission of vibration. Ductwork passing through unconditioned space should be insulated to enhance system performance. When air conditioning is used, a vapor barrier is recommended.

Maintain a 1-in. clearance from combustible materials to supply air ductwork for a distance of 36 in. horizontally from the furnace. See NFPA 90B or local code for further requirements.

For a furnace not equipped with a cooling coil, the outlet duct shall be provided with a removable access panel. This opening shall be accessible when the furnace is installed and shall be of such a size that the heat exchanger can be viewed for possible openings using light assistance or a probe can be inserted for sampling the air stream. The cover attachment shall prevent leaks.

B. Ductwork Acoustical Treatment

Metal duct systems that do not have a 90 degree elbow and 10 ft of main duct to the first branch take-off may require internal acoustical lining. As an alternative, fibrous ductwork may be used if constructed and installed in accordance with the latest edition of SMACNA construction standard on fibrous glass ducts. Both acoustical lining and fibrous ductwork shall comply with NFPA 90B as tested by UL Standard 181 for Class I Rigid air ducts.

C. Supply Air Connections

UPFLOW FURNACES

Connect supply-air duct to 3/4-in. flange on furnace supply-air outlet. The supply-air duct attachment must ONLY be connected to furnace supply-/outlet-air duct flanges or air conditioning coil casing (when used). DO NOT cut main furnace casing to attach supply side air duct, humidifier, or other accessories. All accessories MUST be connected external to furnace main casing.

DOWNFLOW FURNACES

Connect supply-air duct to supply-air opening on furnace. The supply-air duct attachment must ONLY be connected to furnace supply/outlet or air conditioning coil casing (when used), when installed on non-combustible material. When installed on combustible material, supply-air duct attachment must ONLY be connected to an accessory subbase or factory approved air conditioning coil casing. DO NOT cut main furnace casing to attach supply side air duct, humidifier, or other accessories. All accessories MUST be connected external to furnace main casing.

HORIZONTAL FURNACES

Connect supply-air duct to supply air opening on furnace. The supply-air duct attachment must ONLY be connected to furnace supply/outlet or air conditioning coil casing (when used). DO NOT cut main furnace casing to attach supply side air duct, humidifier, or other accessories. All accessories MUST be connected external to furnace main casing.

D. Return Air Connections

The furnace and its return air system shall be designed and installed so that negative pressure created by the air circulating fan cannot affect another appliance’s combustion air supply or act to mix products of combustion with circulating air, and that the air circulating fan of the furnace, if installed in an enclosure communicating with another fuel-burning appliance not of the direct-vent type, shall be operable only when any door or panel covering an opening in the furnace fan compartment or in a return air plenum on ducts in the closed position.

III. INSTALLATION IN HORIZONTAL APPLICATIONS

These furnaces can be installed horizontally in either horizontal left or right discharge position. In a crawlspace, the furnace can either be hung from floor joist or installed on suitable blocks or pad. Furnace can be suspended from each corner by hanger bolts and angle iron supports. (See Fig. 25.) Cut hanger bolts (4 each 3/8-in. all-thread rod) to desired length. Use 1 X 3/8-in. flat washers, 3/8-in. lock washers, and 3/8-in. nuts on hanger rods as shown in Fig. 25. Dimples are provided for hole locations. (See Fig. 2.)

IV. AIR DUCTS

A. General Requirements

The duct system should be designed and sized according to accepted national standards such as those published by: Air Conditioning Contractors Association (ACCA), Sheet Metal and Air Conditioning Contractors National Association (SMACNA) or American Society of Heating, Refrigerating and Air Conditioning Engineers (ASHRAE), or consult The Air Systems Design Guidelines reference tables available from your local distributor. The duct system should be sized to handle the required system design CFM at the design static pressure.
WARNING: FIRE HAZARD
Failure to follow this warning could result in fire, personal injury, or death. Never connect return-air ducts to the back of the furnace. Return-air duct connections on furnace side(s) permitted in upflow applications only.

UPFLOW FURNACES
The return-air duct must be connected to bottom, sides (left or right), or a combination of bottom and side(s) of main furnace casing. Bypass humidifier may be attached into unused side return air portion of the furnace casing. DO NOT connect any portion of return-air duct to back of furnace casing.

DOWNFLOW AND HORIZONTAL FURNACES
The return-air duct must be connected to return-air opening provided. DO NOT cut into casing sides or back to attach any portion of return-air duct. Bypass humidifier connections should be made at ductwork or coil casing sides exterior to furnace.

NOTES:
1. A 1 In. clearance minimum between top of furnace and combustible material.
2. The entire length of furnace must be supported when furnace is used in horizontal position to ensure proper drainage.
3. For non-direct vent/1-pipe application, bottom side combustion-air entry cannot be used when furnace is installed with hangers as shown.

V. FILTER ARRANGEMENT

The air filter arrangement will vary due to application, furnace orientation, and filter type. The filter may be installed in an external Filter/Media cabinet (if provided) or the furnace blower compartment. Factory supplied washable filters are shipped in the blower compartment.

If a factory-supplied external Filter/Media cabinet is provided, instructions for its application, assembly, and installation are packaged with the cabinet. The Filter/Media cabinet can be used with the factory-supplied washable filter or a factory-specified high-efficiency disposable filter (see cabinet instructions).
If installing the filter in the furnace blower compartment, determine location for filter and relocate filter retaining wire if necessary. See Table 4 to determine correct filter size for desired filter location. Table 4 indicates filter size, location, and quantity shipped with this furnace. See Fig. 2 for location and size of bottom and side return-air openings.

**CAUTION:**

Cut Hazard

Failure to follow this caution may result in minor personal injury.

Use care when cutting support rods in filters to protect against flying pieces and sharp rod ends. Wear safety glasses, gloves, and appropriate protective clothing.

**CAUTION:**

Unit May Not Operate

Failure to follow this caution may result in intermittent unit operation or performance satisfaction.

For airflow requirements above 1800 CFM, see Air Delivery table in Product Data literature for specific use of single side inlets. The use of both side inlets, a combination of 1 side and the bottom, or the bottom only will ensure adequate return air openings for airflow requirements above 1800 CFM.

**NOTE:** Side return-air openings can ONLY be used in UPFLOW configurations. Install filter(s) as shown in Fig. 26. Bottom return-air opening may be used with all 4 orientations. Filter may need to be cut to fit some furnace widths. Install filter as shown in Fig. 27.

**NOTE:** Remove and discard bottom closure panel when bottom inlet is used.

**VI. BOTTOM CLOSURE PANEL**

This furnace is shipped with bottom closure panel installed in bottom return-air opening. This panel MUST be in place when side return air is used.

To remove bottom closure panel, perform the following:

1. Tilt or raise furnace and remove 2 screws holding front filler panel. (See Fig. 28.)
2. Rotate front filler panel downward to release holding tabs.
3. Remove bottom closure panel.
4. Reinstall front filler panel and screws.

**VII. GAS PIPING**

Gas piping must be installed in accordance with national and local codes. Refer to current edition of NFPA in the United States.

Canadian installations must be made in accordance with NSCNG-PIC and all authorities having jurisdiction.

Gas supply line should be a separate line running directly from meter to furnace, if possible. Refer to Table 5 for recommended gas pipe sizing.

* Factory-provided with the furnace. Filters may be field modified by cutting filter material and support rods (3) in filters. Alternate sizes and additional filters may be ordered from your distributor or dealer.

† Upflow only. Alternate sizes and additional filters may be ordered from your dealer.
WARNING: FIRE OR EXPLOSION HAZARD
Failure to follow this warning could result in fire, explosion, personal injury, or death.
- Connect gas pipe to furnace using a backup wrench to avoid damaging gas controls.
- Gas valve shutoff switch MUST be facing forward or tilted upward.
- Never purge a gas line into a combustion chamber.
- Never test for gas leaks with an open flame. Use a commercially available soap solution made specifically for the detection of leaks to check all connections.
- Use proper length of pipe to avoid stress on gas control manifold.
- If a flexible connector is required or allowed by authority having jurisdiction, black iron pipe shall be installed at furnace gas valve and extend a minimum of 2 in. outside furnace casing.
- Protect gas valve from water and debris. Gas valve inlet and/or inlet piping must remain capped until gas supply line is permanently installed to protect the valve from moisture and debris. Also, install a sediment trap in the gas supply piping at the inlet to the gas valve.

Install a sediment trap in riser leading to furnace. Trap can be installed by connecting a tee to riser leading to furnace so straight-through section of tee is vertical. Then connect a capped nipple into lower end of tee. Capped nipple should extend below level of gas controls. Place a ground joint union between gas control manifold and manual gas shutoff valve. (See Fig. 29.)

If local codes allow the use of a flexible gas appliance connector, always use a new listed connector. Do not use a connector which has previously served another gas appliance.

* Cubic ft of gas per hr. for gas pressures of 0.5 psig (14-in. wc) or less and a pressure drop of 0.5-in wc (based on a 0.60 specific gravity gas). Ref: Table 9.2 NFGC.

Fig. 28—Removing Bottom Closure Panel

**NOTE:** The gas valve inlet pressure tap connection is suitable to use as test gauge connection providing test pressure DOES NOT exceed maximum 0.5 psig (14-in. wc) stated on gas valve. (See Fig. 51.)

Gas line grommet (factory-supplied loose parts bag) should be used when installing gas piping. Gas line entry hole filler plug should be installed in unused gas line entry hole. (See Fig. 30.)

**WARNING: FIRE OR EXPLOSION HAZARD**
Failure to follow this warning exactly could result in serious injury, death, or property damage.

Never test for gas leaks with an open flame. Use a commercially available soap solution made specifically for the detection of leaks to check all connections. A fire or explosion could result causing property damage, personal injury or loss of life.

![Gas Supply Diagram](A93324)

**Fig. 29—Typical Gas Pipe Arrangement**

An accessible manual shutoff valve MUST be installed external to furnace casing and within 6 ft of furnace. A 1/8-in. NPT plugged tapping, accessible for test gauge connection, MUST be installed immediately upstream of gas supply connection to furnace and downstream of manual shutoff valve.

Piping should be pressure tested in accordance with NFGC, local and national plumbing and gas codes before the furnace has been connected. In Canada, refer to current edition of NSCNGPIC. If the pressure exceeds 0.5 psig (14-in. wc), gas supply pipe must be disconnected from the furnace and capped before pressure test. If test pressure is equal to or less than 0.5 psig (14-in. wc), turn off electric shutoff switch located on furnace gas valve and accessible manual shutoff valve before test. After all connections have been made, purge lines and check for leakage.

![Typical Pipe Arrangement](A93047)

**Fig. 28—Removing Bottom Closure Panel**

VIII. ELECTRICAL CONNECTIONS

See Fig. 31, 32, and 50A-H for field wiring diagram showing typical field 115-v and 24-v wiring. Check all factory and field electrical connections for tightness.
**WARNING:** ELECTRICAL SHOCK HAZARD  
Failure to follow this warning could result in personal injury or death.  
Blower access door switch opens 115-v power to furnace control. No component operation can occur. Do not bypass or close switch with panel removed.

**WARNING:** FIRE HAZARD  
Failure to follow this warning could result in intermittent operation or performance satisfaction.  
Do not connect aluminum wire between disconnect switch and furnace. Use only copper wire. (See Fig. 33.)

**CAUTION:** UNIT MAY NOT OPERATE  
Failure to follow this caution may result in intermittent unit operation.  
Furnace control must be grounded for proper operation or control will lock out. Control is grounded through green/yellow wire routed to gas valve C-terminal and burner box screw.

**WARNING:** ELECTRICAL SHOCK AND FIRE HAZARD  
Failure to follow this warning could result in electrical shock, fire, or death.  
The furnace casing MUST have an uninterrupted or unbroken ground according to NEC ANSI/NFPA 70-2002 and Canadian Electrical Code CSA C22.1 or local codes to minimize personal injury if an electrical fault should occur. This may consist of electrical wire or conduit approved for electrical ground when installed in accordance with existing electrical codes. Do not use gas piping as an electrical ground.

### A. 115-V Wiring

Before proceeding with electrical connections, make certain that voltage, frequency, and phase correspond to that specified on the furnace rating plate. Also, check to be sure that service provided by power supply is sufficient to handle load imposed by this equipment. Refer to rating plate or Table 6 for equipment electrical specifications.

The furnace must be electrically grounded in accordance with local codes; or in the absence of local codes, with the National Electric Code ANSI/NFPA 70 and/or the Canadian Electric Code, CSA C22.1, Part I, if an external electrical source is utilized.

* Permissible limits of voltage range at which unit will operate satisfactorily.
† Unit ampacity = 125 percent of largest operating component’s full load amps plus 100 percent of all other potential operating components’ (EAC, humidifier, etc.) full load amps.
‡ Length shown is measured 1 way along wire path between unit and service panel for maximum 2 percent voltage drop.
** Time-delay type is recommended.

---

### Fig. 30—Typical Gas Pipe Arrangement

Use a separate, fused branch electrical circuit containing a properly sized fuse or circuit breaker for this furnace. See Table 6 for wire size and fuse specifications. A disconnecting means must be located within sight from and readily accessible to furnace.

**NOTE:** Proper polarity and proper grounding must be maintained for 115-v wiring. If polarity is incorrect, control LED status indicator light will flash rapidly and furnace will NOT operate.

Field-supplied wiring shall conform with the limitations of 63°F rise.

**NOTE:** PIPE GROMMETS AND ENTRY HOLE FILLER PLUGS ARE INCLUDED IN FACTORY-SUPPLIED LOOSE PARTS BAG.
Fig. 31—Typical Heating and Cooling Application Wiring Diagram 1-Stage Thermostat and Condensing Unit

1-STAGE THERMOSTAT TERMINALS

NOTES:
1. Connect Y-terminal as shown for proper operation.
2. Some thermostats require a "C" terminal connection as shown.
3. If any of the original wire, as supplied, must be replaced, use same type or equivalent wire.

Fig. 32—Typical Heating and Cooling Application Wiring Diagram 2-Stage Thermostat and Condensing Unit

2-STAGE THERMOSTAT TERMINALS

NOTES:
1. Connect Y-terminal as shown for proper operation.
2. Some thermostats require a "C" terminal connection as shown.
3. If any of the original wire, as supplied, must be replaced, use same type or equivalent wire.
FACTORY INSTALLED J-BOX LOCATION

Install electrical entry hole filler plugs (factory-supplied in loose parts bag) in unused power entry holes. (See Fig. 34.)

J-BOX RELOCATION

1. Remove 2 screws holding auxiliary J-box. (See Fig. 35.)
2. Rotate J-box 180° and attach box to left side, using holes provided.
3. Install electrical entry hole filler plugs (factory-supplied loose parts Bag) in unused power entry holes. (See Fig. 35.)

WARNING: ELECTRICAL SHOCK AND FIRE HAZARD

Failure to follow this warning could result in intermittent unit operation or performance satisfaction. If manual disconnect switch is to be mounted on furnace, select a location where a drill or fastener will not contact electrical or gas components.

B. 24-V Wiring

Make field 24-v connections at 24-v terminal block on furnace. (See Fig. 37.) Connect terminal Y/Y2 as shown in Fig. 31 and 32 for proper cooling operation. Use only AWG No. 18, color-coded, copper thermostat wire for lengths up to 100 ft. For wire lengths over 100 ft, use AWG No. 16 wire.

The 24-v circuit contains an automotive-type, 3-amp fuse located on furnace control. (See Fig. 37.) Any direct shorts of 24-v wiring during installation, service, or maintenance could cause this fuse to blow. If fuse replacement is required, use ONLY a 3-amp fuse of identical size/type. The control will flash code 24 when fuse needs replacement.

C. Accessories

1. Electronic Air Cleaner (EAC)
   Two male quick-connect terminals marked EAC-1 and EAC-2 are provided for EAC connection. (See Fig. 37.) These terminals are energized with 115-v (1.0-amp maximum) during blower motor operation.

2. Humidifier (HUM)
   Connect an accessory 24 VAC, 0.5 amp maximum humidifier (if used) to the 1/4-in. male quick-connect HUM terminal and Cost-24V screw terminal on the control board thermostat strip. The HUM terminal is energized when gas valve is energized. (See Fig. 36 or 37.)

NOTE: A field-supplied, 115-v controlled relay connected to EAC terminals may be added if humidifier operation is desired during blower operation.

CAUTION: UNIT DAMAGE HAZARD

Failure to follow this caution may result in unit component damage.

DO NOT connect furnace control HUM terminal to HUM (humidifier) terminal on Thermidistat™, Zone Controller or similar device. See Thermidistat™, Zone Controller, thermostat, or controller manufacturer’s instructions for proper connection.

IX. REMOVAL OF EXISTING FURNACES FROM COMMON VENT SYSTEMS

When an existing Category I furnace is removed or replaced, the original venting system may no longer be sized to properly vent the remaining attached appliances. An improperly sized Category I venting system could cause the formation of condensate in the furnace and vent, leakage of condensate and combustion products, spillage of combustion products into the living space, etc.

X. COMBUSTION AIR AND VENT PIPE SYSTEMS

A. General

Vent system or vent connectors may need to be resized. For any other appliances when resizing vent systems or vent connectors, system or connector must be sized to approach minimum size as determined using appropriate table found in the NFGC or NSC-NGPIC.

The 352AAV can be vented as either a direct vent (all sizes) or as a non-direct vent (except for 140 size) application. A direct vent system shall be installed in accordance with the direct vent (2-pipe) procedures in the following Combustion Air and Vent Pipe Systems section. For non-direct vent (1-pipe) applications, refer to the non-direct vent (1-pipe) procedures in the same section.

Multistory and common venting are prohibited.

B. Direct Vent/2-Pipe System

In a direct-vent (2-pipe) system, all air for combustion is taken directly from outdoor atmosphere, and all flue products are discharged to outdoor atmosphere. A factory accessory vent termination kit MUST be used in a direct vent (2-pipe) system.

C. Non-Direct Vent/1-Pipe System

In a non-direct vent (1-pipe) system, all air for combustion is taken from the area adjacent to furnace, and all flue products are discharged to outdoor atmosphere. A factory-supplied perforated disk assembly (in loose parts bag) MUST be used in combustion-air pipe elbow.
WARNING: CARBON MONOXIDE POISONING HAZARD
Failure to follow the steps outlined below for each appliance connected to the venting system being placed into operation could result in carbon monoxide poisoning or death.

The following steps shall be followed for each appliance connected to the venting system being placed into operation, while all other appliances connected to the venting system are not in operation:

1. Seal any unused openings in venting system.
2. Inspect the venting system for proper size and horizontal pitch, as required in the National Fuel Gas Code, ANSI Z223.1-2002/NFPA 54-2002 or the CSA B149.1, Natural Gas and Propane Installation Code and these instructions. Determine that there is no blockage or restriction, leakage, corrosion and other deficiencies, which could cause an unsafe condition.
3. As far as practical, close all building doors and windows and all doors between the space in which the appliance(s) connected to the venting system are located and other spaces of the building.
5. Turn on clothes dryers and any appliance not connected to the venting system. Turn on any exhaust fans, such as range hoods and bathroom exhausts, so they are operating at maximum speed. Do not operate a summer exhaust fan.
6. Follow the lighting instructions. Place the appliance being inspected into operation. Adjust the thermostat so appliance is operating continuously.
7. Test for spillage from draft hood equipped appliances at the draft hood relief opening after 5 minutes of main burner operation. Use the flame of a match or candle.
8. If improper venting is observed during any of the above tests, the venting system must be corrected in accordance with the National Fuel Gas Code, ANSI Z223.1-2002/NFPA 54-2002 and/or CSA B149.1, Natural Gas and Propane Installation Code.
9. After it has been determined that each appliance connected to the venting system properly vents when tested as outlined above, return doors, windows, exhaust fans, fireplace dampers and any other gas-fired burning appliance to their previous conditions of use.

D. Materials
Combustion-air and vent pipe, fittings, primers, and solvents must conform to American National Standards Institute (ANSI) standards and American Society for Testing and Materials (ASTM) standards. See Table 7 for approved materials for use in the U.S.A.

WARNING: FIRE AND EXPLOSION HAZARD
Failure to follow this warning could result in fire, property damage, personal injury, or death.
Solvent cements are combustible. Keep away from heat, sparks, and open flame. Use only in well-ventilated areas. Avoid breathing in vapor or allowing contact with skin or eyes.

In Canada, construct all combustion-air and vent pipes for this unit of CSA or ULC listed schedule-40 PVC, PVC-DWV or ABS-DWV pipe and pipe cement. SDR pipe is NOT approved in Canada.

In direct vent (2-pipe) systems, combustion air and vent pipes must terminate together in same atmospheric pressure zone, either through roof or sidewall (roof termination preferred), using accessory termination kit. See Table 8 for required clearances.

In non-direct vent (1-pipe) system, vent pipe termination must be installed with adequate clearances to building openings and equipment to comply with national and local codes. See Table 9 for required clearances.

WARNING: CARBON MONOXIDE POISONING HAZARD
Failure to follow this warning could result in property damage, personal injury, or death.
All combustion-air and vent pipes must be airtight and watertight. Pipes must also terminate exactly as shown in Fig. 44 for direct vent (2-pipe) system and Fig. 45 for non-direct vent (1-pipe) system.

An abandoned masonry chimney may be used as a raceway for properly insulated and supported combustion-air (when applicable) and vent pipes. Each furnace must have its own set of combustion-air and vent pipes and be terminated individually, as shown in Fig. 44 for Direct Vent (2-Pipe) system and Fig. 45 for Non-Direct Vent (1-Pipe) system.

A furnace shall not be connected to a chimney flue serving a separate appliance designed to burn solid fuel.

Other gas appliances with their own venting system may also use the abandoned chimney as a raceway providing it is permitted by local code, the current edition of the National Fuel Gas Code and the vent or liner manufacturer’s installation instructions. Care must be taken to prevent the exhaust gases from one appliance from contaminating the combustion air of other gas appliances.

(1) In accordance with the current CSA B149.1, Natural Gas and Propane Installation Code
(2) In accordance with the current ANSI Z223.1/NFPA 54, National Fuel Gas Code
F 18 " (46 cm) above roof surface
↑ Permitted only if veranda, porch, deck, or balcony is fully open on a minimum of two sides beneath the floor.
* For clearances not specified in ANSI Z223.1/NFPA 54 or CSA B149.1, clearances shall be in accordance with local installation codes and the requirements of the gas supplier and the manufacturer's installation instructions
** A vent shall not terminate above a sidewalk or paved driveway that is located between two single family dwellings and serves both dwellings.

Notes:
1. The vent for this appliance shall not terminate
   a. Over public walkways; or
   b. Near soffit vents or crawl space vents or other areas where condensate or vapor could create a nuisance or hazard or property damage; or
   c. Where condensate vapor could cause damage or could be detrimental to the operation of regulators, relief valves, or other equipment.
2. When locating vent terminations, consideration must be given to prevailing winds, location, and other conditions which may cause recirculation of the combustion products of adjacent vents. Recirculation can cause poor combustion, inlet condensate problems, and accelerated corrosion of the heat exchanger.
3. Avoid venting under a deck or large overhang. Recirculation could occur and cause performance or system problems.

(1) In accordance with the current CSA B149.1, Natural Gas and Propane Installation Code
(2) In accordance with the current ANSI Z223.1/NFPA 54, National Fuel Gas Code
# 14" (36 cm) above roof surface
+ Permitted only if veranda, porch, deck, or balcony is fully open on a minimum of two sides beneath the floor.
* For clearances not specified in ANSI Z223.1/NFPA 54 or CSA B149.1, clearances shall be in accordance with local installation codes and the requirements of the gas supplier and the Manufacturer’s installation instructions.
** A vent shall not terminate above a sidewalk or paved driveway that is located between two single family dwellings and serves both dwellings.

Notes:
1. The vent for this appliance shall not terminate
   a. Over public walkways; or
   b. Near soft soil vents or crawl space vents or other areas where condensate or vapor could create a nuisance or hazard or property damage; or
   c. Where condensate vapor could cause damage or could be detrimental to the operation of regulators, relief valves, or other equipment.
2. When locating vent terminations, consideration must be given to prevailing winds, location, and other conditions which may cause recirculation of the combustion products of adjacent vents. Recirculation can cause poor combustion, inlet condensate problems, and accelerated corrosion of the heat exchangers.
3. Avoid venting under a deck or large overhang. Recirculation could occur and cause performance or system problems.

→ Table 9—Other than Direct Vent Termination Clearance
CAUTION: UNIT MAY NOT OPERATE
Failure to follow this caution may result in intermittent unit operation.

When vent pipe is exposed to temperatures below freezing, such as when it passes through an unheated space or when a chimney is used as a raceway, pipe must be insulated as shown in Table 10 with Armaflex-type insulation.

→ Furnace combustion air and vent pipe connections are sized for 2-in. pipe. Any pipe size change should be made outside furnace casing in vertical pipe. The transition has to be made as close to the furnace as reasonably possible.

→ E. Combustion Air Pipe

GENERAL
Furnace combustion-air connection must be attached as shown in Fig. 38. Combustion-air intake housing plug may need to be relocated in some applications.

For Non-Direct Vent (1-Pipe) system, combustion-air must terminate outside of furnace casing with 1 elbow. Orient elbow so that its opening faces down for upflow or downflow applications. Orient elbow so that its opening faces sideways (left or right) for horizontal left or horizontal right applications. Maintain a 3-in minimum clearance between the opening of the combustion-air inlet pipe and any object.

### CAUTION: UNIT CORROSION HAZARD
Excessive exposure to contaminated combustion air may result in safety and performance related problems. Combustion air must not be taken from inside structure because inside air is frequently contaminated by halogens, which include fluorides, chlorides, bromides, and iodides. These elements are found in aerosols, detergents, bleaches, cleaning solvents, salts, air fresheners, adhesives, paint, and other household products. Locate combustion-air inlet as far as possible from swimming pool and swimming pool pump house.

### NOTE:
All pipe joints must have cemented attachment of combustion-air inlet pipe to inlet housing connection, since it may be necessary to remove pipe for servicing.

### ASSEMBLY OF COMBUSTION AIR PIPE (NON-DIRECT VENT/1-PIPE SYSTEM ONLY)

1. Permanently install perforated disk assembly (factory-supplied in loose parts bag) in combustion-air elbow using RTV or by cementing, as shown in Fig. 39. For 120,000 Btu/h size units only: separate the 2 halves of perforated disk assembly and use only the shouldered disk half.
2. Determine the length of straight portion of combustion-air inlet pipe from Fig. 39.
3. Cut field-supplied 2-in. diameter PVC pipe to length as determined per Fig. 39.
4. Permanently attach elbow/perforated disk assembly to straight portion of pipe using RTV or by cementing as shown in Fig. 39.

* Pipe length (ft) specified for maximum pipe lengths located in unconditioned spaces. Pipes located in unconditioned space cannot exceed total allowable pipe length as specified in Table 11.
† Insulation thickness based on R value of 3.5 per in.
ASSEMBLY OF COMBUSTION AIR PIPE (DIRECT VENT-2-PIPE SYSTEM ONLY)

1. Using Table 12, determine the smallest combustion air diameter permitted. Pick the larger diameter and use it for both combustion and vent pipe.

NOTE: Do not count elbows or pipe sections in terminations or within furnace (All elbows shown in Fig. 44 and Fig. 45 are not to be counted).

CAUTION: UNIT MAY NOT OPERATE
Failure to follow this caution may result in incomplete combustion, flame disturbance, or flame sense lockout. When installing combustion air and vent system of short pipe length, the smallest allowable pipe diameter must be used.

NOTE: A 2-in. diameter pipe must be used within furnace casing. Make all pipe diameter transitions outside furnace casing per Fig. 41.

2. If required per Table 12, insert perforated disk assembly (factory-supplied in loose parts bag) in intake housing where combustion air pipe will be connected. If half disk set is required, install only shouldered disk half.

ATTACHMENT OF COMBUSTION AIR PIPE

1. Determine location of combustion air intake pipe connection to combustion air intake housing as shown in Fig. 38 for application.

2. Reposition combustion air intake housing plug fitting in appropriate unused intake housing connection.

3. Install combustion-air pipe grommet (factory-supplied in loose parts bag) into selected furnace casing combustion-air pipe hole. (See Fig. 40.)

4. Insert assembled combustion air inlet pipe into intake housing as shown in Fig. 38.

5. Drill a 1/8-in. hole in 2-in. combustion air pipe using the hole in intake housing as a guide.

6. Install a field-supplied No. 6 or No. 8 sheet metal screw into combustion air pipe.

Fig. 39—Combustion-Air Inlet Pipe Assembly
7. Install casing hole filler cap (factory-supplied in loose parts bag) in unused combustion air pipe casing hole.

**NOTE:** Do not attach combustion air intake pipe permanently to combustion air intake housing since it may be necessary to remove pipe for service of burner box components or flame sensor.

**ATTACHMENT OF COMBUSTION AIR INTAKE HOUSING PLUG FITTING**

The combustion-air intake plug fitting must be installed in unused combustion air intake housing. This fitting must be attached by using RTV sealant, or by drilling a 1/8-in. hole in fitting, using hole in intake housing as a guide. Install a field-supplied No. 6 or No. 8 sheet metal screw.

**NOTE:** DO NOT OVERTIGHTEN SCREW. Breakage of intake housing or fitting may cause air leakage to occur.

See notes at end of table

A plugged drain connection has been provided on this fitting for use when moisture is found in combustion air intake pipe and combustion box. If use of this drain connection is desired, drill out fitting’s tap plug with 3/16-in. drill and connect a field-supplied 3/8-in. tube. This tube should be routed to open condensate drain for furnace and A/C (if used), and should be trapped, as shown in Fig. 42.

**NOTE:** (Direct Vent/2-Pipe System ONLY). Moisture in combustion air intake may be a result of improper termination. Ensure combustion air pipe termination is similar to those as shown in Fig. 44 so that it will not be susceptible to area where light snow or others sources of moisture could be pulled in.
F. Vent Pipe

GENERAL

Furnace vent connection must be attached as shown in Fig. 38.

WARNING: CARBON MONOXIDE POISONING AND PROPERTY DAMAGE HAZARD

Failure to follow this warning could result in property damage, personal injury, or death.

Vent pipes must be airtight.

NOTE: A 2-in. diameter pipe must be used within the furnace casing. Make all pipe diameter transitions outside furnace casing per Fig. 41.

The minimum vent pipe length for these furnaces is 5 ft. Short pipe lengths (5-8 ft) may discharge condensate droplets. These condensate droplets may be undesirable. A 12-in. minimum offset pipe section is recommended to reduce excessive condensate droplets from exiting vent pipe outlet. (See Fig. 43.)

ATTACHMENT OF VENT PIPE

1. Determine vent pipe diameter and maximum pipe lengths using Table 12.

NOTE: (Direct Vent/2-Pipe ONLY) vent pipe system has the same diameter and same length as combustion air pipe as mentioned in section “Assembly of Combustion Air Pipe (Direct Vent/2-Pipe system ONLY).”

NOTE: Do not count elbows or pipe sections in terminations or within furnace (all elbows shown in Fig. 44 and Fig. 45 are not be counted).

2. Determine location of vent pipe connection to inducer housing as shown in Fig. 38 for application.

3. Install vent pipe grommet (factory-supplied in loose parts bag) into selected furnace casing vent pipe hole. (See Fig. 44.)

4. Reposition elastomeric (rubber) inducer housing outlet cap and clamp to appropriate unused inducer housing connection. Tighten clamp.
CAUTION: UNIT DAMAGE HAZARD
Failure to follow this caution may result in unit component damage.
Inducer housing outlet cap must be installed and fully seated against inducer housing. Clamp must be tightened to prevent any condensate leakage.

5. Be certain that mating surfaces of inducer housing connection elastomeric (rubber) coupling, and 2-in. diameter vent pipe are clean and dry. Assemble the elastomeric (rubber) vent coupling (with 2 loose clamps) onto inducer housing connection. Insert the 2-in. diameter vent pipe through the elastomeric (rubber) coupling and fully into inducer housing connection until it touches a stop inside the inducer housing outlet. Tighten the screws on both clamps to 15-in-lb. of torque. Pipe to inducer housing. Tighten the clamp screws to 15 in.-lb. of torque.

NOTE: Starting at furnace, slope vent pipe a minimum of 1/4-in. per linear ft with no sags between hangers.

CAUTION: UNIT DAMAGE HAZARD
Failure to follow this caution may result in unit component damage.
Vent pipe must be installed and fully seated against inducer housing internal stop. Clamp must be tightened to prevent any condensate leakage.

6. Install casing hole filler cap (factory-supplied in loose parts bag) in unused vent pipe casing hole.
ATTACHMENT OF VENT EXTENSION PIPE

Furnaces with 100,000 Btu/h and larger input are supplied with a PVC vent extension pipe (2-in. diameter by 12-in. long). This pipe has a built-in channel to assist vent condensate disposal. When this vent extension pipe is supplied, it MUST be used to connect the field vent pipe to furnace inducer housing on ALL upflow and downflow applications.

NOTE: See label on vent extension pipe for proper installation. This pipe may be shortened if an elbow is used to connect vent extension tube to field-installed vent pipe.

INSTALLATION GUIDELINES FOR COMBUSTION AIR PIPE AND VENT PIPE

It is recommended that all pipes be cut, prepared, and pre-assembled before permanently cementing any joint.

1. Attach combustion air pipe and vent pipe per instructions in sections “Combustion Air Pipe” and “Vent Pipe.”
2. Working from furnace to outside, cut pipe to required length(s).
3. Deburr inside and outside of pipe.
4. Chamfer outside edge of pipe for better distribution of primer and cement.
5. Clean and dry all surfaces to be joined.
6. Check dry fit of pipe and mark insertion depth on pipe.
7. After pipes have been cut and preassembled, apply generous layer of cement primer to pipe fitting socket and end of pipe to insertion mark. Quickly apply approved cement to end of pipe and fitting socket (over primer). Apply cement in a light, uniform coat on inside of socket to prevent buildup of excess cement. Apply second coat.
8. While cement is still wet, twist pipe into socket with 1/4 turn. Be sure pipe is fully inserted into fitting socket.
9. Wipe excess cement from joint. A continuous bead of cement will be visible around perimeter of a properly made joint.
10. Handle pipe joints carefully until cement sets.
11. Horizontal portions of the venting system shall be supportive to prevent sagging support. Support combustion air piping (if applicable) and vent piping a minimum of every 5 ft (3 ft for SDR-21 or -26 PVC) using perforated metal hanging strap.
12. Slope combustion air piping (if applicable) and vent piping downward towards furnace a minimum of 1/4 in. per linear ft with no sags between hangers.
13. Horizontal portions of the venting system shall be installed so as to prevent the accumulation of condensate.
14. Use appropriate methods to seal openings where combustion air pipe (if applicable) and vent pipe pass through roof or sidewalk.
NOTE: A 12-in. minimum offset pipe section is recommended with short (5-ft. to 8-ft) vent systems. This recommendation is to reduce excessive condensate droplets from exiting the vent pipe.

Fig. 43—Short Vent (5 to 8 ft) System
Fig. 44—Combustion Air and Vent Pipe Termination for Direct Vent (2-pipe) System (All Sizes)

- At least 36 in.
- Vertical separation between combustion air and vent:
  - 8 3/4 in. for 3 in. kit
  - 6 3/4 in. for 2 in. kit
- Maintain 12 in. min. clearance above:
- Abandoned masonry used as raceway (per code)
- Concentric Vent and Combustion Air Roof Termination (preferred)
- At least 36 in.

EXAMPLE:
An 080-12 size furnace located in Indianapolis, elevation 650 ft above sea level, could be installed as either a direct vent/2-pipe system that requires 3 elbows and 32 ft of vent pipe, along with 5 elbows and 34 ft of combustion-air pipe OR a non-direct vent/1-pipe system that requires 3 elbows and 32 ft vent pipe.

For a direct vent/2-pipe system, Table 12 indicates this application would allow a 2-in. diameter vent pipe, but require a 2-1/2 in. diameter combustion air pipe. According to Table 12, 2-in. diameter pipe is good for 35 ft with 3 elbows, but only 30 ft with 5 elbows. Therefore, 2-1/2 in. diameter pipe must be used for both vent and combustion-air pipes since larger required diameter must always be used for both pipes.

For a non-direct vent/1-pipe system, Table 12 indicates that this application would allow a 2-in. diameter vent pipe. If same installations were in Albuquerque, elevation 5250 ft above sea level:
For a direct vent/2-pipe system, Table 12 indicates that 2-1/2 in. diameter vent pipe and combustion-air pipe are required.
For a non-direct vent/1-pipe system, Table 12 indicates that 2-1/2-in. diameter vent pipe is required. If same applications are to be installed at 5001- to 6000 ft elevation:
For a direct vent/2-pipe system, 2-in. pipe is only good for 23 ft (with 3 elbows) and 17 ft (with 5 elbows). Therefore, 2-1/2 in. diameter combustion air and vent pipe must be used.
For a non-direct vent/1-pipe system, a 2-in. diameter pipe is only good for 23 ft with 3 elbows. A 2-1/2-in. diameter vent pipe must be used.

G. Vent Termination

GENERAL
Combustion-air (direct vent/2-pipe system only) and vent pipe must terminate outside structure, either through sidewall or roof. For vent termination clearance, refer to Table 8 for Direct Vent/2-Pipe system and Table 9 for Non-direct Vent/1-Pipe system. For exterior piping arrangements, refer to Fig. 44 for Direct Vent/2-Pipe system and Fig. 45 for Non-Direct/1-Pipe system.

Roof termination is preferred since it is less susceptible to damage or contamination, and it has less visible vent vapors. Sidewall termination require sealing or shielding of building surfaces with a corrosive resistance material due to corrosive combustion products of vent system.

NOTE: (Direct Vent/2-Pipe system ONLY). A factory accessory termination kit MUST be used. See section “Vent Termination Kit (Direct Vent/2-Pipe System Only)” in this instruction. When determining appropriate location for termination, consider the following guidelines:
1. Comply with all clearance requirements stated in Table 8 or Table 9 per application.
2. Termination or termination kit should be positioned where vent vapors will not damage plants/shrubs or air conditioning equipment.
3. Termination or termination kit should be positioned so that it will not be affected by wind eddy, such as inside building corners, nor by recirculation of flue gases, airborne leaves, or light snow.
4. Termination or termination kit should be positioned where it will not be damaged by or subjected to foreign objects such as stones, balls, etc.
5. Termination or termination kit should be positioned where vent vapors are not objectionable.

EXTENDED EXPOSED SIDEWALL PIPES
Sidewall combustion air pipe termination (direct vent/2-pipe system only) and vent pipe termination may be extended beyond area shown in Fig. 44 or in Fig. 45 per application in outside ambient by insulating pipe as indicated in Table 10.
1. Determine combustion air pipe diameter (direct vent/2-pipe system only) and vent pipe diameter, as stated above, using total pipe length and number of elbows.
2. Using winter design temperature (used in load calculations), find appropriate temperature for your application and furnace model.
3. Determine required insulation thickness for exposed pipe length(s).

NOTE: Pipe length(ft) specified for maximum pipe lengths located in unconditioned spaces cannot exceed total allowable pipe length as specified in Table 12.

VENT TERMINATION KIT (DIRECT VENT/2-PIPE SYSTEM ONLY)

NOTE: Always refer to the instructions in termination kit for the latest version.
Combustion air and vent pipes MUST terminate outside structure. A factory accessory termination kit must be installed as shown in Table 13. There are four options of vent/combustion air termination kits available as shown in Table 13.

NOTE: Combustion air pipe must have the same diameter as vent pipe.

CONCENTRIC VENT/COMBUSTION AIR TERMINATION KIT (DIRECT VENT/2-PIPE SYSTEM ONLY)

Determine an appropriate location for termination kit using the guidelines provided in section “Vent Termination: General” in this instruction.
1. Cut one 4-in. diameter hole for 2-in. kit, or one 5-in. diameter hole for 3-in. kit.
2. Loosely assemble concentric vent/combustion air termination components together using instructions in kit.
3. Slide assembled kit with rain shield REMOVED through hole.

NOTE: Do not allow insulation or other materials to accumulate inside of pipe assembly when installing it through hole.

Roof terminations—Locate assembly through roof to appropriate height as shown in Fig. 44.
Sidewall terminations—Locate assembly through sidewall with rain shield positioned no more than 1-in. from wall as shown in Fig. 44.
4. Disassemble loose pipe fittings. Clean and cement using same procedures as used for system piping.
5. Check required dimensions as shown in Fig. 44.

**TWO-PIPE TERMINATION KIT (DIRECT VENT/2-PIPE SYSTEM ONLY)**

Determine an appropriate location for termination kit using the guidelines provided in section "Vent Termination: General" in this instruction.

1. Cut 2 holes, 1 for each pipe, of appropriate size for pipe size being used.
2. Loosely install elbow in bracket and place assembly on combustion-air pipe.
3. Disassemble loose pipe fittings. Clean and cement using same procedures as used for system piping.
4. Check required dimensions as shown in Fig. 44.

**MULTIVENTING AND VENT TERMINATIONS**

When 2 or more 352AAV Furnaces are vented near each other, each furnace must be individually vented. NEVER common vent or breach vent 352AAV furnaces.

(Direct Vent/2-Pipe System ONLY)-When 2 or more 352AAV furnaces are vented near each other, 2 vent terminations may be installed as shown in Fig. 44, but next vent termination must be at least 36 in. away from first 2 terminations. It is important that vent terminations be made as shown in Fig. 44 to avoid recirculation of flue gases.

**XI. CONDENSATE DRAIN**

<table>
<thead>
<tr>
<th><strong>CAUTION: UNIT MAY NOT OPERATE</strong></th>
</tr>
</thead>
<tbody>
<tr>
<td>Failure to follow this caution may result in intermittent unit operation. Unit must not be installed, operated, and then turned off and left in an unoccupied structure during cold weather when temperature drops to 32°F and below unless drain trap and drain line have adequate freeze protection. See Service and Maintenance Instructions for winterizing procedure.</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th><strong>WARNING: PERSONAL INJURY HAZARD</strong></th>
</tr>
</thead>
<tbody>
<tr>
<td>Caution should be taken to prevent draining where slippery conditions may cause personal injuries. Excessive condensate draining may cause saturated soil conditions which could result in damage to plants.</td>
</tr>
</tbody>
</table>

**A. General**

Condensate trap is shipped installed in the blower shelf and factory connected for UPFLOW applications. Condensate trap must be RELOCATED for use in DOWNFLOW and HORIZONTAL applications.

Condensate trap MUST be used for all applications. An external trap is not required when connecting the field drain to this condensate trap.

The field drain connection (condensate trap or drain tube coupling) is sized for 1/2-in. CPVC, 1/2-in. PVC, or 5/8-in. ID tube connection.

Drain pipe and fittings must conform to ANSI standards and ASTM D1785, D2466 or D2846. CPVC or PVC cement must conform to ASTM D2564 or F493. Primer must conform to ASTM F656. In Canada, use CSA or ULC listed schedule 40 CPVC or PVC drain pipe, fittings, and cement.

<table>
<thead>
<tr>
<th><strong>NOTICE</strong></th>
</tr>
</thead>
<tbody>
<tr>
<td>This unit is designed for indoor installation only. Condensate spillage, select a pump with an overflow switch. When a condensate pump is required, select a pump which is approved for condensing furnace applications. To avoid condensate spillage, select a pump with an overflow switch. Frosting condensate left in condensate trap and drain line may cause cracks, and possible water damage may occur. If freeze protection is required, use condensate freeze protection accessory or equivalent 3 to 6 watt per ft at 120-v and 40°F self-regulating, shielded, and waterproof heat tape. See Installation Instructions supplied with accessory or heat tape manufacturer’s recommendations.</td>
</tr>
</tbody>
</table>

1. Fold heat tape in half and wrap on itself 3 times.
2. Locate heat tape between sides of condensate trap back. (See Fig. 47.)
3. Use wire ties to secure heat tape in place. Wire ties can be positioned in notches of condensate trap sides. (See Fig. 47.)
4. Wrap field drain pipe with remaining heat tape, approximately 1 wrap per ft.
5. When using field-supplied heat tape, follow heat tape manufacturer’s instructions for all other installation guidelines.

START-UP ADJUSTMENT AND SAFETY CHECK

CAUTION: FURNACE MAY NOT OPERATE
Failure to follow this caution may result in furnace operation stopping and water pipes freezing during cold weather.
Furnace control must be grounded for proper operation, or control will lock out. Control is grounded through green/yellow wire connected to gas valve C-terminal and burner box screw.

I. GENERAL
The furnace must have a 115-v power supply properly connected and grounded.
NOTE: Proper polarity and proper grounding must be maintained for 115-v wiring. If polarity is incorrect, control status indicator light will flash rapidly and the furnace will not operate.
Natural gas service pressure must not exceed 0.5 psig (14-in. wc), and be no less than 0.16 psig (4.5-in. wc). Thermostat wire connections at R and W/W1 are the minimum required for gas heating operation. W2 must be connected for 2-stage heating thermostats. Com, Y/Y2, and G are required for cooling, heat pumps, and some clock thermostats. These must be made at the 24-v terminal block on the control. (See Fig. 37.) This furnace can be installed with either a single-stage heating or a 2-stage heating thermostat.
For single-stage thermostats, connect thermostat W to W/W1 at furnace control terminal block. (See Fig. 31 and 50H.) For single-stage thermostats, the control will determine, based on length of previous heating on and off cycles, when to operate in low- and high- gas heat for optimum comfort. Setup switch-1 (SW-1) must be in the factory-shipped OFF position. See Fig. 36 and Table 11A and B for setup switch information.
If a 2-stage heating thermostat is to be used, move SW-1 to ON position at end of furnace installation. This overrides built-in control process for selecting high and low fire and allows the 2-stage thermostat to select gas heating modes. The W2 from thermostat must be connected to W2 on control terminal block. (See Fig. 32 and 50A-G.)

II. PRIME CONDENSATE TRAP WITH WATER

CAUTION: UNIT MAY NOT OPERATE
Failure to follow this caution may result in intermittent unit operation or performance satisfaction.
Condensate trap must be PRIMED or proper draining may not occur. The condensate trap has internal chambers which can ONLY be primed by pouring water into the inducer drain side of condensate trap.

1. Remove upper inducer housing drain connection cap. (See Fig. 48.)
2. Connect field-supplied 1/2-in. ID tube to upper inducer housing drain connection.
3. Insert field-supplied funnel into tube.
4. Pour 1 quart of water into funnel/tube. Water should run through inducer housing, overfill condensate trap, and flow into open field drain. (See Fig. 49.)
5. Remove funnel and tube from inducer housing and replace drain connection cap and clamp.
### III. PURGE GAS LINES

After all connections have been made, purge the gas lines and check for leaks.

**WARNING: FIRE AND EXPLOSION HAZARD**

Failure to follow this warning could result in a fire, explosion, personal injury, or death.

Never purge a gas line into a combustion chamber. Never test for gas leaks with an open flame. Use a commercially available soap solution made specifically for the detection of leaks to check all connections, as specified in “Gas Piping” and “Start-up Adjustment, and Safety Check” sections of these instructions.

### IV. SEQUENCE OF OPERATION

Using schematic diagram in Fig. 36, follow the sequence of operation through the different modes. Read and follow diagram very carefully.

**NOTE:** If power interruption occurs during “call for heat” (W/W1 or W/W1 and W2), the control will run the blower for the selected blower off delay period after power is restored, if the thermostat is still calling for gas heating. The amber LED will flash code 12 during this period, after which the LED will be ON continuous as long as no faults are detected. After this period, the furnace will respond to the thermostat normally.

The blower door must be installed for power to be conducted through blower door interlock switch ILK to furnace control CPU, transformer TRAN, inducer motor IDM, blower motor BLWM, hot surface igniter HSI, and gas valve GV.

---

A. **Two-Stage Heating With Single-Stage Thermostat (Adaptive Mode)**

(See Fig. 31 for thermostat connections.)

**NOTE:** Low-heat-only switch, SW-1, selects either the low-heat-only operation mode when ON, or adaptive heating mode when OFF, in response to a call for heat. (See Fig. 37.)

This furnace can operate as a 2-stage furnace with a single-stage thermostat because furnace control CPU includes a programmed adaptive sequence of controlled operation, which selects low-gas-heat or high-gas-heat operation. This selection is based upon the stored history of the length of previous gas heating on/off periods of the single-stage thermostat.

The furnace will start up in either low- or high-gas heat. If the furnace starts up in low-gas heat, the control CPU determines the low-gas heat on time (from 0 to 16 minutes) which is permitted before switching to high-heat.

If power is interrupted, the stored history is erased. When this happens, the control CPU will initially select low-heat for up to 16 minutes and then switch to high-heat, as long as the thermostat continues to “call for heat.” Subsequent selection is based on stored history of thermostat cycle times.

When wall thermostat “calls for heat”, R-W/W1 circuit closes. The furnace control performs a self-check, verifies the low-heat and high-heat pressure switch contacts LPS and HPS are open, and starts inducer motor IDM in high speed.

1. **Inducer Prepurge Period** - If the furnace control CPU selects low-heat operation the inducer motor IDM comes up to speed, the low-heat pressure switch LPS closes, and the furnace control CPU begins a 15-second prepurge period. After the low-heat pressure switch re-closes the furnace control CPU will begin a 15-second prepurge period, and continue to run the inducer motor IDM at high-speed.

   - If the furnace control CPU selects high-heat operation, the inducer motor IDM remains running at high-speed, and the high-heat pressure switch relay HPSR is de-energized to close the NC contact. When sufficient pressure is available the high-heat pressure switch HPS closes, and the high-heat gas valve solenoid GV-HI is energized. The furnace control CPU begins a 15-second prepurge period after the low-heat pressure switch LPS closes. If the high-heat pressure switch HPS fails to close and the low-heat pressure switch LPS closes, the furnace will operate at low-heat gas flow rate until the high-heat pressure switch closes for a maximum of 2 minutes after ignition.

2. **Igniter Warm-Up** - At end of the inducer prepurge period, the Hot Surface Igniter HSI is energized for a 17-sec igniter warm-up period.

3. **Trial-For-Ignition Sequence** - When the igniter warm-up period is completed the main gas valve relay contacts GVR close to energize the gas valve GV, the gas valve opens. The gas valve GV permits gas flow to the burners where it is ignited by the Hot Surface Igniter HSI. Five seconds after the GVR closes, a 2-second flame period begins. The HSI igniter will remain energized until the flame is sensed or until the 2-second flame proving period begins.

4. **Flame-Proving** - When burner flame is proved at the flame-proving sensor electrode FSE, the inducer motor IDM switches to low-speed unless running at high-speed, and the furnace control CPU begins the blower-ON delay period and continues to hold the gas valve GV-M open. If the burner flame is not proved within two seconds, the control CPU will close the gas valve GV-M, and the control CPU will repeat the ignition sequence for up to three more Trials-For-Ignition before going to Ignition-Lockout. **Lock-out will be reset** automatically after three hours, by momentarily interrupting 115 vac power to the furnace, or
by interrupting 24 vac power at SEC1 or SEC2 to the furnace control CPU (not at W/W1, G, R, etc.). If flame is proved when flame should not be present, the furnace control CPU will lock out of Gas-Heating mode and operate the inducer motor IDM on high speed until flame is no longer proved.

5. Blower-On Delay-If burner flame is proven the blower motor BLWM is energized 66 sec after gas valve GV-M is opened.

- **Low-heat**-The blower motor BLWM is energized at LO HEAT speed.
- **Hi-heat**-The BLWM is energized at HI HEAT speed.

Simultaneously, the electronic air cleaner terminal EAC-1 is energized and remains energized as long as the blower motor BLWM is energized.

6. **Switching From Low-To High-Heat**- If the furnace control CPU switches from low-heat to high-heat, the furnace control CPU will switch the inducer motor IDM speed from low to high. The high-heat pressure switch relay HPSR is de-energized to close the NC contact. When sufficient pressure is available the high-heat pressure switch HPS closes, and the high-heat gas valve solenoid GV-HI is energized. The blower motor BLWM will switch to HI HEAT speed five seconds after the furnace control CPU switches from low-heat to high-heat.

7. **Switching From High-To Low-Heat**- The control CPU will not switch from high-heat to low-heat while the thermostat R-to-W circuit is closed when a single-stage thermostat is used.

8. **Blower-Off delay**- When the thermostat is satisfied, the R to W circuit is opened, de-energizing the gas valve GV-M, stopping gas flow to the burners, and de-energizing the humidifier terminal HUM. The inducer motor IDM will remain energized for a 15-second post-purge period. The blower motor BLWM and air cleaner terminal EAC-1 will remain energized for 90, 120, 150, or 180 seconds (depending on selection at blower-OFF delay switches). The furnace control CPU is factory-set for a 120-second blower-OFF delay.

B. **Two-Stage Heating With Two-Stage Thermostat (Non-Adaptive Heating Mode)**

(See Fig. 32 and 50A-G for thermostat connections).

**NOTE:** In this mode, the low-heat only switch must be ON to select the low-heat only operation mode in response to closing the thermostat R-to-W1 circuit. Closing the thermostat R-to-W1 circuit always causes high-heat operation, regardless of the setting of the low-heat-only switch.

The wall thermostat "calls for heat", closing the R to W1 circuit for low-heat or closing the R to W1 and W2 circuits for high-heat. The furnace control performs a self-check, verifies the low-heat and high-heat pressure switch contacts LPS and HPS are open, and starts the inducer motor IDM in high-speed.

The start-up and shutdown functions and delays described in item 1 above apply to 2-stage heating mode as well, except for switching from low- to high-heat and vice versa.

1. **Switching From Low-To High-Heat**- If the thermostat R to W1 circuit is closed and the R to W2 circuit closes, the furnace control CPU will switch the inducer motor IDM speed from low to high. The high-heat pressure switch relay HPSR is de-energized to close the NC contact. When sufficient pressure is available the high-heat pressure switch HPS closes, and the high-heat gas valve solenoid GV-HI is energized. The blower motor BLWM will switch to HI HEAT speed five seconds after the R to W2 circuit closes.

2. **Switching From High-To Low-Heat**- If the thermostat R to W2 circuit opens, and the R to W1 circuit remains closed, the furnace control CPU will switch the inducer motor IDM speed from high to low. The high-heat pressure switch relay HPSR is energized to open the NC contact and de-energize the high-heat gas valve solenoid GV-HI. When the inducer motor IDM reduces pressure sufficiently, the high-heat pressure switch HPS will open. The gas valve solenoid GV-M will remain energized as long as the low-heat pressure switch LPS remains closed. The blower motor BLWM will switch to LO HEAT speed five seconds after the R to W2 circuit opens.

C. **Cooling Mode**

The thermostat “calls for cooling”

1. **Single-Speed Cooling**

(See Fig. 31 or 32 and 50A, C, or E for thermostat connections.)

The thermostat closes R-to-G-and-Y circuits. The R-to-Y circuit starts the outdoor unit, and R-to-G-and-Y/Y2 circuits start the furnace blower motor BLWM on COOL speed.

The electronic air cleaner terminal EAC-1 is energized with 115-v when blower motor BLWM is operating.

When the thermostat is satisfied, the R-to-G-and-Y circuits are opened. The outdoor unit will stop, and furnace blower motor BLWM will continue operating on COOL speed for an additional 90 sec. Jumper Y/Y2 to DHUM to reduce the cooling off-delay to 5 seconds. (See Fig. 37.)

2. **Two-Speed Cooling and Single-Stage Thermostat (Adaptive Mode)**

(See Fig. 31 and 50A-H for thermostat connections.)

This furnace can operate a two-speed cooling unit with a single-stage thermostat because the furnace control CPU includes a programmed adaptive sequence of controlled operation, which selects low-cooling or high-cooling operation. This selection is based upon the stored history of the length of previous cooling period of the single-stage thermostat.

**NOTE:** The air conditioning relay disable jumper ACRDJ must be connected to enable the adaptive cooling mode in response to a call for cooling. (See Fig. 32.) When in place the furnace control CPU can turn on the air conditioning relay ACR to energize the Y/Y2 terminal and switch the outdoor unit to high-cooling.

The furnace control CPU can start up the cooling unit in either low- or high-cooling. If starting up in low-cooling, the furnace control CPU determines the low-cooling on-time (from 0 to 20 minutes) which is permitted before switching to high-cooling.

If the power is interrupted, the stored history is erased and the furnace control CPU will select low-cooling for up to 20 minutes and then energize the air conditioning relay ACR to energize the Y/Y2 terminal and switch the outdoor unit to high-cooling, as long as the thermostat continues to call for cooling. Subsequent selection is based on stored history of the thermostat cycle times.

The wall thermostat "calls for cooling", closing the R to G-and-Y circuits. The R to Y1 circuit starts the outdoor unit on low-cooling speed, and the R to G-and-Y circuits start the furnace blower motor BLWM at low-cool speed (same speed as LO HEAT).

If the furnace control CPU switches from low-cooling to high-cooling, the furnace control CPU will energize the air conditioning relay ACR. When the air conditioning relay ACR is energized the R to Y1-and-Y2 circuits switch the outdoor unit to high-cooling speed, and the R to G-and-Y-and-Y/Y2 circuits switch the furnace blower motor BLWM to COOL speed.
Fig. 50A—Two-Stage Furnace with Single-Speed Air Conditioner

Fig. 50B—Two-Stage Furnace with Two-Speed Air Conditioner

Fig. 50C—Two-Stage Furnace with Single-Speed Heat Pump (Dual Fuel)

Fig. 50D—Two-Stage Furnace with Two-Speed Heat Pump (Dual Fuel)
Fig. 50E—Dual Fuel Thermostat with Two-Stage Furnace and Single-Speed Heat Pump

Fig. 50G—Two-Stage Thermostat With Two-Stage Furnace and Two-Speed Air Conditioner

Fig. 50F—Dual Fuel Thermostat With Two-Stage Furnace and Two-Speed Heat Pump

Fig. 50H—Single-Stage Thermostat With Two-Stage Furnace and Two-Speed Air Conditioner
Notes for Fig. 50A-H:

1. Heat pump **MUST** have a high pressure switch for dual fuel applications.
2. Refer to outdoor equipment Installation Instructions for additional information and setup procedure.
3. Select the "ZONE" position on the two-speed heat pump control.
4. Outdoor Air Temperature Sensor must be attached in all dual fuel applications.
5. Dip switch No.1 on Thermodstat should be set in **OFF** position for air conditioner installations. This is factory default.
6. Dip switch No. 1 on Thermodstat should be set in **ON** position for heat pump installations.
7. Dip switch No. 2 on Thermodstat should be set in **OFF** position for single-speed compressor operation. This is factory default.
8. Dip switch No. 2 on Thermodstat should be set in **ON** position for two-speed compressor operation.
9. Configuration Option No. 10 "Dual Fuel Selection" must be turned **ON** in all dual fuel applications.
10. **NO** connection should be made to the furnace HUM terminal when using a Thermodstat.
11. Optional connection. If wire is connected, dip switch No. 1 on furnace control should be set in **ON** position to allow Thermodstat/Thermostat to control furnace staging.
12. Optional connection. If wire is connected, ACRDJ jumper on furnace control should be removed to allow Thermodstat/Thermostat to control outdoor unit staging.
13. Furnace must control its own high-stage heating operation via furnace control algorithm. This is factory default.
14. The RVS Sensing terminal "L" should not be connected. This is internally used to sense defrost operation.
15. **DO NOT SELECT** the "FURNACE INTERFACE" or "BALANCE POINT" option on the two-speed heat pump control board. This is controlled internally by the Thermodstat/Dual Fuel Thermostat.
16. Dip switch D on Dual Fuel Thermostat should be set in **OFF** position for single-speed compressor operation. This is factory default.
17. Dip switch D on Dual Fuel Thermostat should be set in **ON** position for two-speed compressor operation.
NOTE: When transitioning from low-cooling to high-cooling the outdoor unit compressor will shut down for 1 minute while the BLWM continues to run at low-cool speed (same speed as LO-HEAT) until the outdoor unit compressor comes back on at high speed.

The electronic air cleaner terminal EAC-1 is energized with 115 vac whenever the blower motor BLWM is operating.

When the thermostat is satisfied, the R to G-and-Y circuit is open. The outdoor unit stops, and the furnace blower BLWM and electronic air cleaner terminal EAC-1 will remain energized for an additional 90 seconds. Jumper Y1 to DHUM to reduce the cooling off-delay to 5 seconds. (See Fig. 37.)

3. Two-Speed Cooling and Two-Stage Thermostat
(See Fig. 32 and Fig. 50A-G for thermostat connections)

NOTE: The ACRDJ must be disconnected to allow thermostat control of the outdoor unit staging. (See Fig. 37.)

The thermostat closes the R to G-and-Y1 circuits for low-cooling or closes the R to G-and-Y1-and-Y2 circuits for high-cooling. The R to Y1 circuit starts the outdoor unit on low-cooling speed, and the R to G-and-Y1 circuit starts the furnace blower motor BLWM on low-cool speed (same speed as LO HEAT).

The R to Y1-and-Y2 circuits start the outdoor unit on high-cooling speed, and the R to G-and-Y2 circuits start the furnace blower motor BLWM on COOL speed.

The electronic air cleaner terminal EAC-1 is energized with 115 vac whenever the blower motor BLWM is operating.

When the thermostat is satisfied, the R to G-and-Y1 or R to G-and-Y1-and-Y2 circuits are opened. The outdoor unit stops, and the furnace blower BLWM and electronic air cleaner terminal EAC-1 will remain energized for an additional 90 seconds. Jumper Y1 to DHUM to reduce the cooling off-delay to 5 seconds. (See Fig. 37.)

D. Thermidistat Mode
(See Fig. 50A-D for Thermidistat connections.)

The dehumidification output, DHUM on the Thermidistat should be connected to the furnace control thermostat terminal DHUM. When there is a dehumidify demand, the DHUM input is activated, which means 24 vac signal is removed from the DHUM input terminal. In other words, the DHUM input logic is reversed. The DHUM input is turned ON when no dehumidify demand exists. Once 24 vac is detected by the furnace control on the DHUM input, the furnace control operates in Thermidistat mode. If the DHUM input is low or OFF for more than 48 hours, the furnace control reverts back to non-Thermidistat mode.

The cooling operation described above also applies to operation with a Thermidistat. The exceptions are listed below:

a. When the R to G-and-Y1 circuit is closed and there is a demand for dehumidification, the furnace blower motor BLWM will continue running at low-cool speed (same speed as LO HEAT).

b. When the R to G-and-Y2 circuit is closed and there is a demand for dehumidification, the furnace blower motor BLWM will drop the blower speed from COOL to HI HEAT for a maximum of 10 minutes before reverting back to COOL speed. If there is still a demand for dehumidification after 20 minutes, the furnace control CPU will drop the blower speed back to HI HEAT speed. This alternating 10-minute cycle will continue as long as there is a call for cooling.

c. When the “call for cooling” is satisfied and there is a demand for dehumidification, the cooling blower-off delay is decreased from 90 seconds to 5 seconds.

E. Continuous Blower Mode
When the R to G circuit is closed by the thermostat, the blower motor BLWM will operate on continuous-blower speed (can be set to LO HEAT, HI HEAT, or COOL speed). Factory default is LO HEAT speed. Terminal EAC-1 is energized as long as the blower motor BLWM is energized.

During a call for heat, the blower BLWM will stop during igniter warm-up (17 seconds), ignition (7 seconds), and blower-ON delay (66 seconds), allowing the furnace heat exchangers to heat up more quickly, then restarts at the end of the blower-ON delay period at LO HEAT or HI HEAT speed respectively.

In high-heat, the furnace control CPU will hold the blower motor BLWM at HI HEAT speed during the selected blower-OFF delay period before reverting to continuous-blower speed.

When the thermostat “calls for low-cooling”, the blower motor BLWM will switch to operate at low-cool speed (same speed as LO HEAT). When the thermostat is satisfied, the blower motor BLWM will operate an additional 90 seconds on low-cool speed before reverting back to continuous-blower speed.

When the thermostat “calls for high-cooling”, the blower motor BLWM will operate at COOL speed. When the thermostat is satisfied, the blower motor BLWM will operate an additional 90 seconds on COOL speed before reverting back to continuous-blower speed.

When the R to G circuit is open, the blower motor BLWM will continue operating for an additional 5 seconds, if no other function requires blower motor BLWM operation.

Continuous Blower Speed Selection from Thermostat -To select different continuous-blower speeds from the room thermostat, momentarily turn off the FAN switch or push-button on the room thermostat for 1-3 seconds after the blower motor BLWM is operating. The furnace control CPU will shift the continuous-blower speed from the factory setting of LO HEAT to HI HEAT speed. Momentarily turning off the FAN switch again at the thermostat will shift the continuous-blower speed from HI HEAT to COOL. Repeating the procedure will shift the continuous-blower speed from COOL to LO HEAT speed. The selection can be changed as many times as desired and is stored in the memory to be automatically used following a power interruption.

F. Heat Pump
(See Fig. 50C-F for thermostat connections)

When installed with a heat pump, the furnace control automatically changes the timing sequence to avoid long blower off times during demand defrost cycles. When the R to W/W1-and-Y1 or R to W/W1-and-Y1-and-G circuits are energized, the furnace control CPU will switch to or turn on the blower motor BLWM at low cool speed (same speed as LO HEAT), and begin a low-heat cycle. The blower motor BLWM will remain on until the end of the prepurge period, then shut off for 24 seconds then come back on at LO HEAT speed. When the W/W1 input signal disappears, the furnace control begins a normal inducer post-purge period and the blower remains running at LO HEAT speed. If the R to W/W1-and-Y1-and-G signals disappear at the same time, the blower motor BLWM will remain on for the selected blower-OFF delay period. If the R to W/W1-and-Y1 signals disappear, leaving the G signal, the blower motor BLWM will remain on for the selected blower-OFF delay period then switch to continuous-blower speed.

When the R to W/W1-and-Y2, R to W/W1-and-Y2-and-G, R to W/W1-and-Y1-and-Y2, or R to W/W1-and-Y1-and-Y2-and-G circuits are energized the furnace control CPU will switch to or turn on the blower motor BLWM at COOL speed, and begin a high-heat cycle. The blower motor BLWM will remain on until the end of the prepurge period, then shut off for 24 seconds then come back on at HI HEAT speed. When the W/W1 input signal disappears, the furnace control begins a normal inducer post-purge period and the blower switches to COOL speed after a 3 second delay. If the R to W/W1-and-Y2-and-G or R to W/W1-and-Y1-and-Y2-and-G signals disappear at the same time, the blower
motor BLWM will remain on for the selected blower-OFF delay period. If the R to W/W1-and-Y/Y2 or R to W/W1-and-Y1-and-Y/Y2 signals disappear, leaving the G signal, the blower motor BLWM will remain on for the selected blower-OFF delay period then switch to continuous-blower speed.

G. Component Self-Test

**NOTE:** The furnace control component test allows all components to run for a short time; except the gas valve and humidifier terminal HUM are not energized for safety reasons. The EAC-1 terminal is energized when blower is energized. This feature helps diagnose a system problem in case of a component failure. The component test feature will not operate if any thermostat signal is present at control and not until all time delays are completed.

To Begin Component Self-Test:

1. Remove blower access door.
2. Disconnect thermostat R lead from furnace control.
3. Manually close blower door switch.
4. For approximately 2 sec, short (jumper) the Com-24v terminal on control to the TEST/TWIN 3/16-in. quick-connect terminal on control until LED turns off. Remove jumper from terminals. (See Fig. 37.)

**NOTE:** If TEST/TWIN and Com-24v terminals are jumpered longer than 2 sec, LED will flash rapidly and ignore component test request.

Component test sequence for 2-stage furnace is as follows:

- a. LED will display previous status code 4 times.
- b. Inducer motor starts on high-speed and continues to run until Step g of component test sequence.
- c. Hot surface igniter is energized for 15 sec, then off.
- d. Blower motor operates on LO-HEAT speed for 10 sec.
- e. Blower motor operates on HI-HEAT speed for 10 sec.
- f. Blower motor operates on COOL speed for 10 sec.
- g. Inducer motor goes to low-speed for 10 sec, then stops.

5. Reconnect R lead to furnace control, remove tape from blower door switch, and re-install blower door.
6. Operate furnace per instruction on outer door.
7. Verify furnace shut down by lowering thermostat setting below room temperature.
8. Verify that furnace restarts by raising thermostat setting above room temperature.

H. Operate Furnace

Follow procedures on operating instructions label attached to furnace.

I. Furnace Restart

With furnace operating, set thermostat below room temperature and observe that furnace goes off. Set thermostat above room temperature and observe that furnace restarts.

V. ADJUSTMENTS

A. Set Gas Input Rate

Furnace gas input rate on rating plate is for installations at altitudes up to 2000 ft.

In the U.S.A., the input ratings for altitudes above 2000 ft must be reduced by 2 percent for each 1000 ft above sea level.

In Canada, the input ratings must be derated by 5 percent for altitudes of 2001 ft to 4500 ft above sea level.

Adjust manifold pressure to obtain input rate.

Furnace input rate must be within ± 2 percent of input on furnace rating plate adjusted for altitude.

1. Determine Natural Gas Orifice Size And Manifold Pressure For Correct Input.
   a. Obtain average gas heat value (at installed altitude) from local gas supplier.
   b. Obtain average gas specific gravity from local gas supplier.
   c. Verify furnace model and size. Table 14 can only be used for model 352AAV furnaces with heating inputs of 20,000/13,000 (High/Low) Btuh per burner.
   d. Find installation altitude in Table 14.

   **NOTE:** For Canada altitudes of 2001 to 4500 ft, use U.S.A. altitudes of 2001 to 3000 ft in Table 14.
   e. Find closest natural gas heat value and specific gravity on Table 14.
   f. Follow heat value and specific gravity lines to point of intersection to find orifice size and manifold pressure settings for proper operation.

   **EXAMPLE:** (0-2000 ft altitude using Table 14)
   Heating value = 1050 Btu/cu ft
   Specific gravity = 0.62
   Therefore: Orifice No. 45
   Manifold pressure 3.6-in. wc for high heat
   1.5-in. wc for low heat
   * Furnace is shipped with No. 45 orifices. In this example all main burner orifices are the correct size and do not need to be changed to obtain the proper input rate.

   g. Check and verify burner orifice size in furnace. NEVER ASSUME ORIFICE SIZE; ALWAYS CHECK AND VERIFY.

2. Adjust Manifold Pressure To Obtain Input Rate.
   a. Remove burner enclosure front.

   **NOTE:** Manifold pressure MUST always be measured with burner enclosure front REMOVED.

   b. Remove regulator seal caps that conceal adjustment screws for low-and high heat gas valve pressure regulators. (See Fig. 51.)
   c. Move setup switch SW-1 on control center to ON position. This keeps furnace locked in low-heat operation.
   d. Jumper R and W/W1 thermostat connections on control to start furnace.
   e. Turn low-heat adjusting screw (3/32 hex Allen wrench) counterclockwise (out) to decrease input rate or clockwise (in) to increase input rate.

   **NOTE:** DO NOT set low-heat manifold pressure less than 1.3-in. wc or more than 1.7-in. wc for natural gas. If manifold pressure is outside this range, change main burner orifices to obtain pressure in this range.

3. Verify Natural Gas Input Rate By Clocking Gas Meter.

NOTE: Be sure all pressure tubing, combustion-air and vent pipes, and burner enclosure front are in place when checking input by clocking gas meter.

CAUTION: UNIT DAMAGE HAZARD
Failure to follow this caution may result in component damage due to flame impingement of burners and heat exchangers.

DO NOT redrill orifices. Improper drilling (burrs, out-of-round holes, etc.) can cause excessive burner noise and misdirection of burner flames. (See Fig. 53.)

3. Verify Natural Gas Input Rate By Clocking Gas Meter.

NOTE: Be sure all pressure tubing, combustion-air and vent pipes, and burner enclosure front are in place when checking input by clocking gas meter.

</tbody>
</table>

* Derate multiplier factor is based on midpoint altitude for altitude range.

e. Check and verify orifice size in furnace. NEVER ASSUME THE ORIFICE SIZE. ALWAYS CHECK AND VERIFY.

f. Turn off all other gas appliances and pilots.

g. Move setup switch SW-1 to ON position. This keeps furnace locked in low-heat operation.
h. Jumper R-to-W/W1.
i. Let furnace run for 3 minutes in low-heat operation.
j. Measure time (in sec) for gas meter to complete 1 revolution. Note reading.
k. Refer to Table 16 for cubic ft of gas per hr.
l. Multiply gas rate cu ft/hr by heating value (Btu/cu ft).
m. Move setup switch SW-1 to OFF position and jumper R and W1 and W2 thermostat connections. This keeps furnace locked in high-heat operation. Repeat items ‘i’ through ‘l’ for high-heat operation.

EXAMPLE: (0-2000 ft altitude)
Furnace input from rating plate is 100,000 Btu/h.
Btu heating input = Btu/cu ft X cu ft/hr
Heating value of gas = 975 Btu/cu ft
Time for 1 revolution of 2-cu ft dial = 70 sec
Gas rate = 103 cu ft/hr (from Table 16)
Btu heating input = 103 X 975 = 100,425 Btuh. In this example, the orifice size and manifold pressure adjustment is within ±2 percent of the furnace input rate.

NOTE: Measured gas inputs (high-heat and low-heat) must be within ±2 percent of that stated on furnace rating plate when installed at sea level or derated per that stated above when installed at higher altitudes.

n. Remove jumper across R, W/W1, and W2 thermostat connections to terminate call for heat.

B. Set Temperature Rise

CAUTION: UNIT DAMAGE HAZARD
Failure to follow this caution may result in overheating the heat exchangers or condensing flue gases in heat exchanger areas not designed for condensate. Temperature rise must be within limits specified on furnace rating plate. Recommended operation is at midpoint of rise range or slightly above.

Place SW-1 in ON position. Jumper R to W/W1 and W2 to check high-gas-heat temperature rise. To check low-gas-heat temperature rise, remove jumper to W2. Determine air temperature rise for both high and low gas heat. Do not exceed temperature rise ranges specified on unit rating plate for high and low gas heat.

This furnace must operate within the temperature rise ranges specified on the furnace rating plate. Determine the air temperature as follows:

a. Place duct thermometers in return and supply ducts as close to furnace as possible. Be sure thermometers do not ‘see’ heat exchangers so that radiant heat does not affect thermometer readings. This is particularly important with straight run ducts.

b. When thermometer readings stabilize, subtract return-air temperature from supply-air temperature to determine temperature rise.

If the temperature rise is outside this range, check the following:

a. Gas input for low- and high gas heat operation.

b. Derate for altitude if applicable.

c. Return and supply ducts for excessive restrictions causing static pressures greater than 0.50-in. wc.

d. Adjust temperature rise by adjusting blower speed. Increase blower speed to reduce temperature rise. Decrease blower speed to increase temperature rise.

WARNING: ELECTRICAL SHOCK HAZARD
Failure to follow this warning could result in personal injury or death.
Disconnect 115-v electrical power before changing speed tap.

For high-heat, the following connections can be made at HI HEAT on control:

a. Med-high (Yellow)

b. Med (Orange) - Available only on 5-speed motors. Factory setting for these motors.

---54---
c. Med-Low (Blue) - Do NOT use for HI GAS-HEAT on 80K & 120K Btuh input models. Factory setting for 4-speed motors.

**CAUTION: UNIT DAMAGE HAZARD**
Failure to follow this caution may result in damage to the heat exchangers due to over temperature or condensate corrosion.

1. NEVER connect Low Speed (Red) wire to "HI HEAT".
2. Do NOT connect Medium Low Speed (Blue) wire to "HI - HEAT" on 80,000 Btuh and 120,000 Btuh input model sizes.

For low-heat, the following connections can be made at LO-HEAT on control:

a. Med (Orange) - Available only on 5-speed motors
b. Med-Low (Blue)
c. Low (RED) - Factory setting.

To change blower motor speed selections for heating mode, remove blower motor lead from control HI-HEAT terminal. (See Fig. 37.) Select desired blower motor speed lead from one of the other motor leads and relocate it to HI-HEAT terminal. See Table 17 for lead color identification. Reconnect original lead on SPARE terminal. Follow this same procedure for proper selection of LO-HEAT and COOL speed selection.

Set Blower Off Delay

a. Remove Blower Access Door if installed.
b. Turn Dip switch 2 and 3 ON or OFF for desired blower off delay. See Table 11A and B or Fig. 36 and 37.

C. Adjust Blower Off Delay (Heat Mode)
If desired, the main blower off time delay period may be lengthened or shortened when operating in the heating mode to provide greater comfort. See Table 11 for position of switches and Fig. 36 or 37 for location of switches on control center.

D. Set Thermostat Heat Anticipator
When using a nonelectronic thermostat, the thermostat heat-anticipator must be set to match the amp draw of the electrical components in R-W/W1 circuit. Accurate amp draw readings can be obtained at thermostat subbase terminals R and W.

Fig. 54 illustrates an easy method of obtaining actual amp draw. The amp reading should be taken after blower motor has started and furnace is operating in low heat. To operate furnace in low-heat, first move SW-1 to ON position, then connect ammeter wires as shown in Fig. 54. The thermostat anticipator should NOT be in the circuit while measuring current. If thermostat has no subbase, the thermostat must be disconnected from R and W/W1 wires during current measurement Return SW-1 to final desired location after completing the reading.

See thermostat manufacturer’s instructions for adjusting heat anticipator and for varying heating cycle length.

**VI. CHECK SAFETY CONTROLS**
This section covers the safety controls that must be checked before the installation is complete. The flame sensor, gas valve, and pressure switch were all checked in the Start-up procedure section as part of normal operation.

1. Check Primary Limit Control
   This control shuts off gas control system and energizes air-circulating blower motor if furnace overheats.

   Recommended method of checking this limit control is to gradually block off return air after furnace has been operating for a period of at least 5 minutes. As soon as limit control has shut off burners, return-air opening should be unblocked to permit normal air circulation. By using this method to check limit control, it can be established that limit is functioning properly and operates if there is a restricted return-air supply or motor failure. If limit control does not function during this test, cause must be determined and corrected.

2. Check Pressure Switch
   This control proves operation of draft inducer. Check switch operation as follows:
   a. Turn off 115-v power to furnace.
   b. Remove outer furnace door and disconnect inducer motor lead wires from wire harness.
   c. Turn on 115-v power to furnace.
   d. Set thermostat to "call for heat" and wait 1 minute. When pressure switch is functioning properly, hot surface igniter should not glow, and status code LED flashes a Status Code 32. If hot surface ignitor glows when inducer motor is disconnected, shut furnace down immediately. Determine reason pressure switch did not function properly and correct condition.
   e. Turn off 115-v power to furnace.
   f. Reconnect inducer motor leads, reinstall main furnace door, and turn on 115-v power supply.
CHECKLIST

1. Put away tools and instruments. Clean up debris.
2. Check SW-1 through SW-3 after completing installation to ensure desired settings for thermostat type (SW-1) and blower-OFF delay (SW-2 and SW-3).
3. Verify flame rollout manual reset switch has continuity.
4. Verify that blower and outer doors are properly installed.
5. Cycle test furnace with room thermostat.
6. Check operation of accessories per manufacturer’s instructions.
8. Leave literature packet near furnace.
